PT      Synthesis of polynucleotide useful during fabrication of an array
XX      involves coupling nucleoside phosphoramidite and a solid-supported
XX      nucleoside and treating the product with an oxidation/deprotection
XX      composition.
XX
PS      Example 1; Page 15; 36pp; English.
XX
CC      The present invention relates to a method for the synthesis of a
XX      polynucleotide which involves coupling a second nucleoside to a first
XX      nucleoside through a phosphite linkage, where the second nucleoside has a
XX      non-carbonate protecting group protecting a hydroxyl, and exposing the
XX      product to a composition which concurrently oxidizes the phosphite formed
XX      to a phosphate and deprotects the protected hydroxyl of the second
XX      nucleoside. The method is useful for synthesizing the polynucleotides,
XX      for carrying out either 3' to 5' or 5' to 3' synthesis and for
XX      fabricating an addressable array of polynucleotides on a substrate. The
XX      present sequence is an oligonucleotide produced to demonstrate the method
XX      of the invention

PT      Inhibiting skin inflammation associated with skin disorder e.g.
XX      psoriasis, by administering composition comprising delipidated and
XX      deglycolipidated Mycobacterium vaccae cells or Mycobacterium vaccae
XX      culture filtrate.
XX
PS      Example 5; Col 99-100; 116pp; English.
XX
CC      The present invention relates to a method of inhibiting skin inflammation
XX      associated with a skin disorder selected from psoriasis, atopic
XX      dermatitis and allergic contact dermatitis, which involves administering
XX      a composition containing delipidated and deglycolipidated Mycobacterium
XX      vaccae cells or M. vaccae culture filtrate. The skin disorder to be
XX      treated may also include alopecia areata, and skin cancers such as basal
XX      cell carcinoma, squamous cell carcinoma and melanoma. The composition
XX      acts by inhibiting the Th2 immune response. The present sequence is a
XX      probe described in the exemplification of the invention

 XX PT New non-antibody proteins having an immunoglobulin fold, useful in  
 PT research, therapeutic or diagnostic fields, particularly as scaffolds for  
 PT designing proteins with specific properties, e.g. for binding any antigen  
 PT of interest.  
 XX PS Disclosure; Page 58; 94pp; English.  
 XX CC The present invention describes a non-antibody protein, comprising a  
 CC domain having an immunoglobulin-like fold, derived from a reference  
 CC protein having a mutated amino acid sequence, where the non-antibody  
 CC protein binds with a Kd at least as tight as 10 nM to a compound that is  
 CC not bound as tightly by the reference protein. The non-antibody protein  
 CC is useful as scaffolds for selecting or designing a protein framework  
 CC with specific and favourable properties, e.g. for binding any antigen of  
 CC interest, or for destroying or inactivating antibody molecules. The non-  
 CC antibody protein is also useful in all areas where antibodies are used,  
 CC e.g. research, therapeutic or diagnostic fields, and for screening novel  
 CC binding proteins useful in the above-mentioned fields. The present  
 CC proteins have thermodynamic properties superior to those of natural  
 CC antibodies, and can be evolved rapidly in vitro. The present proteins or  
 CC antibody mimics exhibit improved biophysical properties, such as  
 CC stability under reducing conditions and solubility at high  
 CC concentrations. In addition, these molecules are readily expressed and  
 CC folded in prokaryotic systems (e.g. Escherichia coli), in eukaryotic  
 CC systems (e.g. yeast), or in in vitro translation systems (e.g. rabbit  
 CC reticulocyte lysate system). Furthermore, these proteins are extremely  
 CC amenable to affinity maturation techniques involving multiple cycles of  
 CC selection, e.g. in vitro selection using RNA-protein fusion technology,  
 CC phage display or yeast display systems. The present sequence is used in  
 CC the exemplification of the present invention

XX New DNA sequences from potato, useful for producing plants with altered

PT properties, e.g. tolerance of flooding, also related proteins, antibodies

PT and inhibitory sequences.

XX Example 1; Page 8; 26pp; German.

XX The invention relates to DNA sequences (I) that encode six specific plant

CC proteins: (i) a protein (ABP60425) with mitochondrial carrier protein

CC activity (IIa); (ii) a protein (ABP60426) with transferrin binding

CC protein activity (IIb); (iii) a protein (ABP60427) with receptor-like

CC protein kinase activity (IIc); (iv) a protein (ABP60428) with elongation

CC factor EF-2 activity (IId); (v) a protein (ABP60429) with non-long

CC terminal repeat retroelement reverse transcriptase activity (IIf); or

CC (vi) a protein (ABP60430) with helicase activity (IIIf). (I), also related

CC sequences, derived ribozymes and antisense sequences, expression vectors,

CC encoded proteins and antibodies against the proteins, are used to produce

CC plants with altered properties, including tolerance of overwatering. The

CC antibodies are also used for isolation of the proteins and in

CC immunoassays. Also (I) or their primer or probe fragments are used to

CC screen for terminators and constitutively, aerobically or anaerobically

CC inducible plant promoters, specifically for use in potatoes and the

CC sequence that encodes (IId) is used to alter the translation profile in

CC plants. Since (I) are derived from potato, their promoters and

CC terminators provide high level transgene expression in potato, with

CC improved tissue specificity and inducibility, and can also be used to

CC control endogenous genes. The present sequence is that of a PCR primer

CC used in the first strand synthesis of cDNAs derived from potato

PT Detecting nucleic acids having at least 2 portions comprises use of

PT nanoparticles which have oligonucleotides attached to them that are

XX complementary to portions of the nucleic acid sequence.

XX Example 18; Page 44; 130pp; English.

XX The invention relates to detecting a nucleic acid (NA) having at least 2

CC portions, comprises providing a type of nanoparticles (NP) having

CC attached to oligonucleotides (O) (O) on each NP has a sequence

CC complementary to sequence of at least 2 portions of NA, contacting NA

CC and NP to allow hybridisation of (O) on NP with 2 or more portions of NA,

CC and observing a detectable change brought about by hybridisation of (O)

CC on NP with NA. The nanoparticle is useful for separating a selected

CC nucleic acid having at least 2 portions, from other nucleic acids, and

CC for detecting nucleic acids having at least 2 portions. The method of

CC using NP is useful for detecting any type of nucleic acids which may be

CC used for diagnosis of disease and in sequencing of nucleic acids.

CC Preferably, the method is useful for detecting nucleic acids for

CC diagnosis and/or monitoring of viral diseases (human immunodeficiency

CC virus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr

CC virus), bacterial diseases, sexually transmitted diseases, inherited

CC disorders, in forensics, in DNA sequencing, for paternity testing, for

CC cell line authentication and for monitoring gene therapy. The method is

CC useful in research and analytical laboratories in DNA sequencing and in

CC the field to detect the presence of specific pathogens. Detecting nucleic

CC acids based on observing a colour change with the naked eye is cheap,

CC fast, simple and robust, and do not require specialised expensive

CC equipment. The present sequence is a nanoparticle (e.g. gold particles)

XX labelled probe used to demonstrate the method of the invention

XX
XX Detecting nucleic acids having 2 portions e.g. for detecting disease,
XX comprises use of nanoparticles which have oligonucleotides attached to
XX them that are complementary to portions of the nucleic acid sequence.
XX
XX Example 18; Page 43; 129pp; English.
XX
XX This invention relates to a novel method for detecting a nucleic acid
XX having 2 portions. The method comprises providing nanoparticles having
XX oligonucleotides attached, where the oligonucleotide on each nanoparticle
XX has a sequence complementary to a sequence of 2 portions of nucleic acid
XX The nucleic acid and nanoparticle are contacted to allow hybridisation of
XX the oligonucleotide on the nanoparticle with two or more portions of
XX nucleic acid and observing a detectable change brought about by the
XX hybridisation. The method of the invention is useful for separating a
XX selected nucleic acid having 2 portions, from other nucleic acids, and
XX for detecting nucleic acids having 2 portions. The method of the
XX invention is useful for detecting any type of nucleic acids which may be
XX used for diagnosis of disease and in sequencing of nucleic acids.
XX Preferably, the method is useful for detecting nucleic acids for
XX diagnosis and/or monitoring of viral diseases (human immunodeficiency
XX virus), bacterial diseases, herpes virus, cytomegalovirus and Epstein-Barr
XX disorders, in forensics, in DNA sequencing, for paternity testing, for
XX cell line authentication, for monitoring gene therapy, etc. This method
XX involves detecting nucleic acids based on observing a colour change with
XX the naked eye so is cheap, fast, simple and robust, and does not require
XX specialised expensive equipment. The present sequence represents a thiol
XX modified oligonucleotide sequence used to demonstrate the method of the
XX invention

XX
XX Detecting nucleic acid having two portions, by providing nanoparticles
PT having oligonucleotides attached to it, contacting nucleic acid and
PT nanoparticles to allow hybridization, and observing detectable change,
PT useful in forensics.
XX
XX Example 18; Page 44; 130pp; English.
XX
XX This invention relates to a novel method for detecting nucleic acid
CC sequences having two portions. The method involves providing
CC nanoparticles having oligonucleotides attached to them, which has a
CC sequence complementary to sequence of two portions of nucleic acid,
CC contacting nucleic acid and nanoparticles, to allow hybridisation of
CC oligonucleotides with two or more portions of nucleic acid, and observing
CC a detectable change brought about by hybridisation. The method of the
CC invention and the aggregate probes are useful for detecting two or more
CC nucleic acids (from a biological source) having at least two portions,
CC such as viral RNA or DNA, bacterial or fungal DNA, a gene associated with
CC a disease, synthetic, or structurally-modified natural or synthetic RNA
CC or DNA, or a product of a polymerase chain reaction amplification.
CC Nanoparticles and nanoparticle- oligonucleotide conjugates of the
CC invention are useful for nanofabrication, and for separating a selected
CC nucleic acid having two portions from other nucleic acids. The method of
CC the invention is useful in forensics, DNA sequencing, for paternity
CC testing, cell line authentication, and monitoring gene therapy.
CC Diagnostic assays employing the nanoparticle-oligonucleotide conjugates
CC of the invention improve the sensitivity of the nucleic acid detection
CC assay. The present sequence represents a thiol modified oligonucleotide
CC sequence used to demonstrate the method of the invention

PT Detection of nucleic acid having -2 portions used to prepare biomaterials  
 PT and in nanofabrication methods, comprises providing nanoparticles,  
 PT contacting nucleic acid and nanoparticles, and observing change.  
 XX

Example 18; Page 44; 130pp; English.

CC This invention relates to a novel method for detecting nucleic acids. The  
 CC method comprises providing nanoparticles with oligonucleotides attached  
 CC to them, which have a sequence complementary to a sequence of two  
 CC portions of nucleic acid, contacting the nucleic acid and nanoparticles  
 CC to allow hybridisation of the oligonucleotides with two or more portions  
 CC of the nucleic acid, and observing a detectable change brought about by  
 CC the hybridisation. The nucleic acid to be detected must have at least two  
 CC portions and the distances between these are chosen so that when the  
 CC nanoparticle-oligonucleotide conjugate binds the target sequence a  
 CC detectable change occurs. The method of the invention is useful for  
 CC least two portions, such as viral RNA, bacterial or fungal DNA, a gene  
 CC associated with a disease, synthetic, or structurally- modified natural  
 CC amplification. Nanoparticle-oligonucleotide conjugates of the invention  
 CC are useful for preparing a nanoprobe conjugate for detecting an analyte,  
 CC and for detecting a nucleic acid bound to an electrode surface.  
 CC Nanoparticles and nanoparticle conjugates of the invention are useful for  
 CC nanofabrication and for separating a selected nucleic acid having two  
 CC portions from other nucleic acids. Diagnostic assays employing

CC nanoparticle-oligonucleotide conjugates improve the sensitivity of  
CC nucleic acid detection methods and can be used to detect nucleic acids  
CC that are present in only small amounts in a sample. The invention also  
CC provides highly desirable nanoparticle-oligonucleotide conjugates. These  
CC conjugates are stable with tailored hybridisation abilities. The present  
CC sequence represents a thiol modified oligonucleotide sequence used to  
CC demonstrate the method of the invention

XX PT Hairpin sensor useful for detecting a target nucleotide sequence in a

XX PT sample, comprises a hairpin loop assembly including a complementary probe

XX PT and a quenchable fluorescing agent.

XX PS Example 3; Page 11; 16pp; English.

XX CC The invention discloses a hairpin sensor comprising a hairpin loop

XX CC assembly including a complementary probe positioned between a first

XX CC inverse repeat arm and a second inverse repeat arm, and a quenchable

XX CC fluorescing agent joined, directly or indirectly, to the end of the

XX CC second inverse repeat arm of the hairpin loop assembly opposite the

XX CC complementary probe. Also claimed is a microarray comprising the hairpin

XX CC sensor, where the end of the first inverse repeat arm opposite the

XX CC complementary probe is bound, directly or indirectly, to a support, a kit

XX CC for detecting a target nucleotide sequence in a sample comprising the

XX CC hairpin sensor, and a support, and a hairpin sensor system, in which the

XX CC particle is conductive or semi-conductive, including at least one of the

XX CC above hairpin sensor assemblies. The hairpin sensor further comprises a

XX CC functional group joined to the end of the first inverse repeat arm

XX CC opposite the complementary probe, or first spacer opposite the first

XX CC inverse repeat arm, the functional group selected from amino, carboxyl,

XX CC thiol and hydroxyl. Further, the sensor comprises a ligand positioned

XX CC between the second inverse repeat arm and the quenchable fluorescing

XX CC agent, where the ligand is selected from mercapto, hydroxyl, amino,

XX CC nitrile and carboxyl, carboxylic acid, organic acid and amino acid. The

XX CC second spacer is positioned between the second inverse repeat arm and the

XX CC quenchable fluorescing agent which comprises a semiconductor nanocrystal

XX CC or rhodamine B-labelled dye. Within the microarray the support is capable

XX CC of accepting a charge. At least one hairpin sensor comprises two or more

XX CC hairpin sensors. The two or more hairpin sensors include complementary

XX CC probes that are the same or different and respective quenchable

XX CC fluorescing agents that are the same or different. The two or more

XX CC hairpin sensors are arranged in a spatially-defined pattern. The sensor

XX CC and system are useful for detecting a target nucleotide sequence in a

XX CC sample. Further, the method involves identifying the target nucleotide

XX CC sequence by the location of the complementary probe to which the target

XX CC nucleotide sequence binds. The two or more hairpin sensors include

XX CC complementary probes or quenchable fluorescing agents, that are

XX CC different. The sequence presented is the hairpin oligonucleotide target

XX CC sequence, #2, used in an example of the invention.

XX PT Detecting nucleic acids having at least 2 portions comprises use of

XX PT nanoparticles which have oligonucleotides attached to them that are

XX PT complementary to portions of the target nucleic acid sequence.

XX PS Example 18; Page 44; 130pp; English.

XX CC The invention relates to detecting a nucleic acid (NA) having at least 2

XX CC portions comprising providing a type of nanoparticles (NP, e.g. colloidal

XX CC gold) having oligonucleotides (O) attached (where (O) on each NP has a

XX CC sequence complementary to sequence of at least two portions of NA),

XX CC contacting NA and NP to allow hybridisation of (O) on NP with 2 or more

XX CC portions of NA, and observing a detectable change brought about by

XX CC hybridization of (O) on NP with NA. Also included are aggregate probes,

XX CC core probes, substrate having NP attached to it, a metallic or

XX CC semiconductor NP having (O) attached to it, nanomaterials/nanostructures

XX CC comprising nanoparticles and methods of nanofabrication utilising

XX CC nanoparticles and satellite probes. The methods, probes nucleic acids,

XX CC nanoparticles and oligonucleotides are useful for separating a selected

XX CC nucleic acid having at least two portions, from other nucleic acids, and

XX CC for detecting nucleic acids having at least two portions, for detecting

XX CC NA having at least two portions. The method is useful for detecting any

XX CC type of nucleic acids which may be used for diagnosis of disease and in

XX CC sequencing of nucleic acids. Preferably, the method is useful for

XX CC detecting nucleic acids for diagnosis and/or monitoring of viral diseases

XX CC (human immunodeficiency virus, hepatitis virus, herpes virus,

XX CC cytomegalovirus and Epstein-Barr virus), bacterial diseases, sexually

XX CC transmitted diseases, inherited disorders, in forensics, in DNA

XX CC sequencing, for paternity testing, for cell line authentication, for

XX CC monitoring gene therapy, etc. The method is useful in research and

CC analytical laboratories in DNA sequencing, in the field to detect the  
 CC presence of specific pathogens, etc. Detecting nucleic acids based on  
 CC observing a colour change with the naked eye is cheap, fast, simple and  
 CC robust, and do not require specialised expensive equipment. The present  
 CC sequence is a spacer oligonucleotide used to illustrate the method of the  
 CC invention.

XX Detecting nucleic acid having two portions, by providing nanoparticles

PT having oligonucleotides attached to it, contacting nucleic acid and

PT nanoparticles to allow hybridization, and observing detectable change.

XX Example 18; Page 43; 129pp; English.

PS The invention relates to a novel method for detecting nucleic acids. The

XX method comprises providing nanoparticles with oligonucleotides attached

CC to them, which have a sequence complementary to a sequence of two

CC portions of nucleic acid, contacting the nucleic acid and nanoparticles

CC to allow hybridisation of the oligonucleotides with two or more portions

CC of the nucleic acid, and observing a detectable change brought about by

CC the hybridisation. The nucleic acid to be detected must have at least two

CC portions and the distances between these are chosen so that when the

CC nanoparticle-oligonucleotide conjugate binds the target sequence a

CC detectable change occurs. The method of the invention is useful for  
 CC detecting two or more nucleic acids (from a biological source) having at  
 CC least two portions, such as viral RNA, bacterial or fungal DNA, a gene  
 CC associated with a disease, synthetic, or structurally-modified natural  
 CC or synthetic RNA or DNA, or a product of a polymerase chain reaction  
 CC amplification. Nanoparticle-oligonucleotide conjugates of the invention  
 CC are useful for preparing a nanoprobe conjugate for detecting an analyte,  
 CC and for detecting a nucleic acid bound to an electrode surface.  
 CC Nanoparticles and nanoparticle conjugates of the invention are useful for  
 CC nanofabrication and for separating a selected nucleic acid having two  
 CC portions from other nucleic acids. Diagnostic assays employing  
 CC nanoparticle-oligonucleotide conjugates improve the sensitivity of  
 CC nucleic acid detection methods and can be used to detect nucleic acids  
 CC that are present in only small amounts in a sample. The present sequence  
 CC represents a thiol modified oligonucleotide sequence used to demonstrate  
 CC the method of the invention

Non-nucleotide probe for suppressing binding of detectable nucleic acid  
 PT probes to undesired sequences, has aggregate nucleobase sequence  
 PT homologous to randomly distributed repeat sequence of genomic nucleic  
 PT acid.  
 XX  
 PS Claim 10; SEQ ID NO 14; 103pp; English.

The present sequence represents a non-nucleotide probe. The probe is  
 CC useful for suppressing the binding of one or more detectable nucleic acid  
 CC probes, that are greater than 100 base pairs and that have been derived  
 CC from genomic nucleic acid, to one or more undesired sequences in an assay  
 CC for determining target genomic nucleic acid of a sample. The method  
 CC comprises contacting the sample with the mixture of probes (preferably  
 CC comprising 5-50 probes), contacting the sample with the one or more  
 CC detectable nucleic acid probes, and determining the target genomic  
 CC nucleic acid of the sample by determining the hybridization of the one or  
 CC more detectable nucleic acid probes to the target genomic nucleic acid of  
 CC the sample. The genomic nucleic acid is contained in a fixed tissue or a  
 CC cell, and the sample is metaphase spreads, interphase nucleic or nucleic  
 CC found in paraffin embedded tissue material or frozen tissue sections. The  
 CC probe is also useful in comparing a sample of genomic nucleic acid with  
 CC that of a control sample using a genomic nucleic acid reference array.  
 CC The method comprises treating a sample of genomic nucleic acid and  
 CC control genomic nucleic acid, which are differentially labelled, the  
 CC array or both the sample and control genomic nucleic acid and the array  
 CC with the mixture of the probe under suitable hybridization conditions,  
 CC contacting the array with treated mixture of sample and control genomic  
 CC nucleic acid under suitable hybridization conditions, and comparing the  
 CC intensities of the signals from the differential labels of the array to  
 CC that caused by hybridization of the probes to genomic nucleic acid, thus  
 CC determining one or more variations in copy numbers of sequences in the  
 CC sample as compared with the relative copy numbers of substantially  
 CC identical sequences in the control. The hybridization of the genomic  
 CC array is determined using an intercalating dye or a detectable antibody,

CC or its fragment, that is specific for a nucleic acid/nucleic acid hybrid.  
 CC The sample of genomic nucleic acid to be tested and the reference of  
 CC nucleic acid are labelled with detectable moiety such that hybridization  
 CC of the genomic array is determined by determining the presence, absence,  
 CC amount or location of the detectable label on the one or more genomic  
 CC arrays. The genomic array comprises nucleic acid that is prepared from  
 CC Bacterial Artificial Chromosome (BAC) clones. The present sequence  
 CC represents a non-nucleotide probe of the invention.

XX Pharmaceutical composition for treating ailments associated with impaired  
 PT respiration, has oligo(s) antisense to specific gene(s) or its  
 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or  
 PT ubiquinone.

XX Disclosure; SEQ ID NO 4123; 872pp; English.

XX The invention relates to a novel pharmaceutical composition, which has a

CC first active agent comprising an oligonucleotide antisense to the  
 CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
 CC junctions of genes encoding a polypeptide associated with lung and/or  
 CC nasal airway dysfunction and a second active agent comprising an  
 CC antiinflammatory steroid and ubiquinone. A composition of the invention  
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
 CC immunosuppressive, and cytostatic activity. The composition may have a  
 CC use in antisense gene therapy. The composition is useful for treating or  
 CC preventing a respiratory, lung or malignant disease or condition, also  
 CC for enhancing the prophylactic or therapeutic respiratory effect of an  
 CC antiinflammatory steroid in a subject, for reducing or depleting levels  
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
 CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
 CC lung inflammation, lung allergies, or a respiratory disease or condition.  
 CC Note: The sequence data for this patent is not represented in the printed  
 CC specification, but was obtained in electronic format directly from WIPO

XX Pharmaceutical composition for treating ailments associated with impaired  
 PT respiration, has oligo(s) antisense to specific gene(s) or its  
 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or  
 PT ubiquinone.

XX Disclosure; SEQ ID NO 4057; 872pp; English.

XX The invention relates to a novel pharmaceutical composition, which has a

CC first active agent comprising an oligonucleotide antisense to the  
 CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
 CC junctions of genes encoding a polypeptide associated with lung and/or  
 CC nasal airway dysfunction and a second active agent comprising an  
 CC antiinflammatory steroid and ubiquinone. A composition of the invention  
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
 CC immunosuppressive, and cytostatic activity. The composition may have a  
 CC use in antisense gene therapy. The composition is useful for treating or  
 CC preventing a respiratory, lung or malignant disease or condition, also  
 CC for enhancing the prophylactic or therapeutic respiratory effect of an  
 CC antiinflammatory steroid in a subject, for reducing or depleting levels  
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
 CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
 CC lung inflammation, lung allergies, or a respiratory disease or condition.

DR

XX Pharmaceutical composition for treating ailments associated with impaired  
 PT respiration, has oligo(s) antisense to specific gene(s) or its  
 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or  
 PT ubiquinone.

XX Claim 15; SEQ ID NO 553; 872pp; English.

XX The invention relates to a novel pharmaceutical composition, which has a

CC first active agent comprising an oligonucleotide antisense to the  
 CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
 CC junctions of genes encoding a polypeptide associated with lung and/or  
 CC nasal airway dysfunction and a second active agent comprising an  
 CC antiinflammatory steroid and ubiquinone. A composition of the invention  
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and  
 CC immunosuppressive, and cytostatic activity. The composition may have a  
 CC use in antisense gene therapy. The composition is useful for treating or  
 CC preventing a respiratory, lung or malignant disease or condition, also  
 CC for enhancing the prophylactic or therapeutic respiratory effect of an  
 CC antiinflammatory steroid in a subject, for reducing or depleting levels  
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
 CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
 CC lung inflammation, lung allergies, or a respiratory disease or condition.  
 CC Note: The sequence data for this patent is not represented in the printed  
 CC specification, but was obtained in electronic format directly from WIPO  
 CC at ftp.wipo.int/pub/published\_pct\_sequences

XX Pharmaceutical composition for treating ailments associated with impaired  
 PT respiration, has oligo(s) antisense to specific gene(s) or its  
 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or  
 PT ubiquinone.

XX Claim 15; SEQ ID NO 775; 872pp; English.

XX The invention relates to a novel pharmaceutical composition, which has a

CC first active agent comprising an oligonucleotide antisense to the  
 CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
 CC junctions of genes encoding a polypeptide associated with lung and/or  
 CC nasal airway dysfunction and a second active agent comprising an  
 CC antiinflammatory steroid and ubiquinone. A composition of the invention  
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
 CC immunosuppressive, and cytostatic activity. The composition may have a  
 CC use in antisense gene therapy. The composition is useful for treating or  
 CC preventing a respiratory, lung or malignant disease or condition, also  
 CC for enhancing the prophylactic or therapeutic respiratory effect of an  
 CC antiinflammatory steroid in a subject, for reducing or depleting levels  
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
 CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
 CC lung inflammation, lung allergies, or a respiratory disease or condition.  
 CC Note: The sequence data for this patent is not represented in the printed  
 CC specification, but was obtained in electronic format directly from WIPO

XX Detecting nucleic acids having 2 portions e.g. for detecting disease,

PT comprises use of nanoparticles which have oligonucleotides attached to

PT them that are complementary to portions of the nucleic acid sequence.

XX Example 18; Page 44; 130pp; English.

XX This invention relates to a novel method for detecting a nucleic acid

CC having 2 portions. The method comprises providing nanoparticles having

CC oligonucleotides attached, where the oligonucleotide on each nanoparticle

CC has a sequence complementary to a sequence of 2 portions of nucleic acid.

CC The nucleic acid and nanoparticle are contacted to allow hybridisation of

CC the oligonucleotide on the nanoparticle with two or more portions of

CC nucleic acid and observing a detectable change brought about by the

CC hybridisation. The method of the invention is useful for separating a

CC selected nucleic acid having 2 portions, from other nucleic acids, and

CC for detecting nucleic acids having 2 portions. The method of the

CC invention is useful for detecting any type of nucleic acids which may be

CC used for diagnosis of disease and in sequencing of nucleic acids.

CC Preferably, the method is useful for detecting nucleic acids for

CC diagnosis and/or monitoring of viral diseases (human immunodeficiency

CC virus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr

CC virus), bacterial diseases, sexually transmitted diseases, inherited

CC disorders, in forensics, in DNA sequencing, for paternity testing, for

CC cell line authentication, for monitoring gene therapy, etc. This method

CC involves detecting nucleic acids based on observing a colour change with

CC the naked eye so is cheap, fast, simple and robust, and does not require

CC specialised expensive equipment. The present sequence represents a thiol

CC modified oligonucleotide sequence used to demonstrate the method of the

CC invention

XX Detection or quantification of nucleic acid analyte, by hybridizing a

PT nucleic acid probe having non-identical covalently attached dyes, with

PT nucleic acid analyte, and measuring change in fluorescence of the probes.

XX Example 9; Page 32; 110pp; English.

XX The present sequence is an example of nucleic acid probes of the

CC invention. The probe may be doubly labelled with non-identical covalently

CC attached dyes, e.g. the fluorescent intercalator ethidium, which serves

CC as the detector dye and the fluorescent dye fluorescein, which serves as

CC the donor dye of a fluorescent resonance energy transfer (FRET) system. A

CC bifunctional linker was used to attach the dyes to the oligonucleotide.

CC The probe generates a fluorescent signal upon hybridisation to a

CC complementary nucleic acid based on the interaction of the intercalator

CC with the formed double-stranded DNA. Nucleic acid probes of the invention

CC can be used in homogeneous assays, real-time PCR monitoring,

CC transcription assays, expression analysis on nucleic acid microarrays and

CC other microarray applications such as genotyping

XX Preparing internucleotide phosphorothioate linkage enhanced in Sp/Rp

PT enantiomer, by coupling a synthon with 2'-substituted nucleoside in

PT presence of coupling agent having a pKa that enhances linkage in Sp/Rp

PT enantiomer.

XX

PS Example 1; Page 31; 65pp; English.

XX The present invention describes a method (M1) for preparing an

CC internucleotide phosphorothioate linkage enriched in the Sp or Rp

CC enantiomer between a synthon having a hydroxyl moiety at the 5' position

CC and a 2'-substituted nucleoside having an activated phosphate moiety at

CC the 3'-position, comprising coupling a synthon with a 2'-substituted  
 CC nucleoside in the presence of coupling agent that is selected to enhance  
 CC either the Rp or Sp enantiomer according to its pKa. This method is  
 CC useful for preparing an oligonucleotide having at least one region of  
 CC internucleotide linkages that is enhanced in the Sp or Rp enantiomer,  
 CC which involves providing a nucleotide having a hydroxyl moiety at the 5'-  
 CC position or a growing oligonucleotide chain having a hydroxyl moiety at  
 CC the 5'-position, coupling the nucleotide or growing oligonucleotide chain  
 CC to a 2'-substituted nucleoside having an activated phosphate moiety at  
 CC the 3' position in the presence of the coupling agent, and repeating the  
 CC coupling step until the desired number of linkages is established. The  
 CC oligonucleotide having a region of internucleotide linkages that is  
 CC enhanced in the Sp enantiomer is further processed to include another  
 CC region of internucleotide linkages that is enhanced in the Sp and/or Rp  
 CC enantiomer. Oligonucleotides prepared by the method lead to improved  
 CC drugs, diagnostics and research reagents. The present sequence represents  
 CC an oligonucleotide used in the exemplification of the present invention

XX Pharmaceutical composition for treating asthma, has antitense

PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.

PS Claim 15; SEQ ID NO 3509; 763pp; English.

XX This invention describes a novel composition (a) a first active agent,

CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has antiallergic, antiinflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.  
 XX  
 PS Claim 15; SEQ ID NO 3861; 763pp; English.  
 XX  
 CC This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating

CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposcretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

DR WPI; 2003-093058/08.

XX Pharmaceutical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.

XX Claim 15; SEQ ID NO 4483; 763pp; English.

XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc., tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

XX Pharmaceuical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.

XX Claim 15; SEQ ID NO 553; 763pp; English.

XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

 XX Pharmacological composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.  
 XX Claim 15; SEQ ID NO 4683; 763pp; English.  
 XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc., tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

XX CC hybridization of nucleic acid with substrate or particle bound

XX CC oligonucleotides.

XX CC Example 18; SEQ ID NO 55; 130pp; English.

XX CC The invention relates to a method of detecting a nucleic acid with at  
 least two portions by providing a type of nanoparticle-oligonucleotide  
 conjugate, contacting the nucleic acid and nanoparticles to allow  
 hybridisation of the oligonucleotides with the two or more portions of  
 the nucleic acid and observing a detectable change brought about by  
 hybridisation. The oligonucleotides have a sequence complementary to the  
 sequence of at least two portions of the nucleic acid. Hybridisation of  
 the oligonucleotides on the nanoparticles with the nucleic acid results  
 in a detectable change. This sequence represents a linking  
 oligonucleotide of the invention.

XX Amplifying for RNA in a sample, useful for improving RNA polymerase based  
PT RNA transcription from a polynucleotide template, comprises eliminating  
PT single-stranded oligonucleotide from the transcription sample.  
XX Example 2; SEQ ID NO 11; 26pp; English.  
XX The invention relates to amplifying for RNA in a sample comprises  
CC eliminating single-stranded oligonucleotide from the transcription  
CC sample. The method involves synthesizing single-stranded cDNA by  
CC incubating the sample RNA with reverse transcriptase and an  
CC oligonucleotide primer that primes synthesis in a direction toward 5' end  
CC of the RNA; converting the single-stranded cDNA into double-stranded cDNA  
CC to form a transcription sample containing a cDNA template; eliminating  
CC single-stranded oligonucleotide from the transcription sample; and  
CC transcribing the cDNA template into RNA using an RNA polymerase. The  
CC method is useful for improving RNA polymerase based RNA transcription  
CC from a polynucleotide template. The method inhibits the undesired non-  
CC template derived production of RNA in the transcription reaction. The  
CC present sequence represents an oligonucleotide used to exemplify RNA  
CC transcription in the presence of single- and double-stranded  
CC oligonucleotides.

XX Analysis of sample molecules such as DNA fragment, by using micro channel  
PT to form laminar flow of specimen molecule-containing solution and complex  
PT forming molecule containing solution.  
XX  
XX Example 1; Page 9; 19pp; Japanese.  
XX The invention relates to a novel method involving forming a laminar flow,  
CC by passing into a micro channel, a solution containing the specimen  
CC molecules, and a solution containing probe molecules capable of forming a

CC complex with the specimen molecules. The dispersion of the formed complex  
CC is selectively promoted, based on their affinity, and the degree of  
CC dispersion of the complex formed between the specimen molecules and the  
CC probe molecules is detected and analysed. The probe molecules are capable  
CC of producing fluorescence. This polynucleotide sequence represents an  
XX oligo used in the exemplification of the invention.

XX Novel polyalkyleneamine-containing oligomeric compound useful for  
PT preventing or delaying infection, inflammation or tumor formation in  
PT organisms.  
XX  
PS Example 3; Page 22; 37pp; English.  
XX  
XX The invention relates to a polyalkyleneamine-containing oligomeric  
CC compound (OC). Also described is a compound (C) comprising an oligomeric  
CC part, a fusogenic part, and a targeting part; and enhancing the cellular  
CC uptake of OC, by conjugating OC to a fusogenic part. In (C), the  
CC fusogenic part is covalently linked to the oligomeric part. The targeting  
CC part is covalently linked to the oligomeric or fusogenic part. Where the  
CC fusogenic part is a lipophilic polyamine, polyethylenimine,  
CC polyallylamine, fusogenic peptide, oligomeric imidazole, histidine,  
CC pyridine, hydroxylamine, substituted hydroxylamine, hydrazine,

CC substituted hydrazine, thiourea or imine. The targeting part is a ligand  
 CC that binds to a cellular reporter, where the targeting part is  
 CC transferrin, folate, epidermal growth factor, nerve growth factor,  
 CC insulin, alpha-fetoprotein, galactose, galactosamine, lactose, mannose, a  
 CC polyclonal antibody, monoclonal antibody, vitamin B12, ibuprofen,  
 CC cholesterol, low-density lipoprotein, peptide comprising an arginine-  
 CC glycine-aspartic acid sequence. The oligomeric part is an  
 CC oligonucleotide, and oligonucleotide analogue, a peptide nucleic acid or  
 CC a peptide nucleic acid analogue. OC is useful as a prodrug, useful in  
 CC diagnostics, therapeutics and as research reagents and kits. OC is useful  
 CC for preventing or delaying infection, inflammation or tumour formation in  
 CC organisms. The present sequence represents an oligonucleotide used in the  
 CC method of the invention.

XX FT Novel single or multiple target oligonucleotide anti-sense to e.g.  
 FT initiation codons and introns of respiratory disease-relevant genes e.g.,  
 FT CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory  
 FT disease e.g., asthma.

XX PS Claim 2; SEQ ID NO 1791; 85pp; English.

XX CC The present invention relates to an oligonucleotide anti-sense to e.g.,  
 CC initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-  
 CC end of nucleic acid target comprising gene(s) chosen from e.g.  
 CC interleukin (IL)-4 receptor, IL-5 receptor or salts of the  
 CC oligonucleotide and optionally surfactant operatively linked to the  
 CC oligonucleotide. The method is useful for preventing or treating a  
 CC respiratory or lung disease, which involves administering to the airways  
 CC of a subject an effective amount of an inhibitor. The oligonucleotide is

CC useful for production of a medicament for the prevention and/or treatment  
 CC of a respiratory or lung disease. The respiratory or lung disease is  
 CC chosen from airway inflammation, allergy(ies), asthma, impeded  
 CC respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases  
 CC (COPD), allergic rhinitis (AR), acute respiratory distress syndrome  
 CC (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway  
 CC obstruction. The present sequence represents an oligonucleotide of the  
 CC invention.

XX Detection of nucleic acid, e.g. viral RNA or DNA, comprises contacting  
 XX nucleic acid with different types of nanoparticles having attached  
 XX oligonucleotides and observing detectable change brought about by

PT hybridization.  
XX  
PS Example 24; SEQ ID NO 70; 206pp; English.  
XX  
XX The invention relates to a novel method for detecting a nucleic acid  
CC having at least two portions comprising contacting the nucleic acid with  
CC at least two types of nanoparticles, such as gold, having attached  
CC oligonucleotides and observing a detectable change brought about by  
CC hybridisation of the oligonucleotides on the nanoparticles with the  
CC nucleic acid. The method of the invention may be useful for detecting a  
CC nucleic acid, preferably viral RNA or DNA, bacterial DNA, a gene  
CC associated with a disease, a fungal DNA, synthetic DNA or RNA,  
CC structurally modified natural or synthetic DNA or RNA or a product of a  
CC polymerase chain reaction amplification. The detected nucleic acid may be  
CC utilised for diagnosis of disease, sequencing of nucleic acids,  
CC forensics, paternity testing, cell line authentication and monitoring  
CC gene therapy. The method for detecting the nucleic acid is based on  
CC observing a colour change with the naked eye and is cheap, fast, simple,  
CC and robust, requiring no specialised or expensive equipment. The current  
CC sequence is that of the oligonucleotide which is related to a thiol-  
CC modified oligonucleotide-gold colloid conjugate probe of the invention.

XX
XX Preparation of phosphorothioate oligonucleotides involves oxidizing
PT phosphite intermediate with acetyl disulfide in acetonitrile for time to
PT effect conversion of phosphite intermediate to phosphorothioate.
XX
XX Example 12; SEQ ID NO 10; 8pp; English.
XX
XX The invention relates to phosphorothioate oligonucleotides having
CC nucleoside with 240 modification are prepared by phosphorylating 5'-
CC hydroxyl of a nucleic acid moiety having a nucleoside with 2'
CC modification in an acetonitrile containing solvent mixture to form a
CC phosphite intermediate; and oxidising the phosphite intermediate with an
CC acetyl disulfide in an acetonitrile for a time to effect conversion of
CC the phosphite intermediate to phosphorothioate. The invented method
CC achieves high yields and greater efficiency. The present sequence is
CC sulphurised oligonucleotide used in the exemplification of the invention.

XX
PS Claim 4; SEQ ID NO 186; 132pp; English.
XX
CC The present sequence represents a chimeric antisense oligonucleotide
CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC human mPGES-1 gene is located on chromosome 9, more specifically to
CC 9q34.3. The present invention also describes: (1) antisense compounds,
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC inhibits its expression; (2) a method of inhibiting the expression of
CC mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC having a disease or condition associated with mPGES-1. mPGES-1 chimeric
CC antisense oligonucleotides and antisense compounds have cytostatic,
CC antidiabetic, immunomodulator, cardiant, neuroprotective,
CC antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC ophthalmological, immunomodulatory and cardiovascular activities, and can
CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC can be used for preparing a composition for treating a disease or
CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC ophthalmic, immunological, cardiovascular or neurological disorder.

XX      New antisense compound, having a sequence targeted to a nucleic acid
XX      encoding mPGES-1, useful for preparing a composition for treating e.g.,
XX      inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
XX      ischemia.
XX
XX      Claim 4; SEQ ID NO 205; 132pp; English.
XX
XX      The present sequence represents a chimeric antisense oligonucleotide
XX      targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
XX      human mPGES-1 gene is located on chromosome 9, more specifically to
XX      9q34.3. The present invention also describes: (1) antisense compounds,
XX      having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
XX      mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
XX      inhibits its expression; (2) a method of inhibiting the expression of
XX      mPGES-1 in cells or tissues; and (3) a method of treating an animal
XX      having a disease or condition associated with mPGES-1. mPGES-1 chimeric
XX      antisense oligonucleotides and antisense compounds have cytostatic,
XX      antidiabetic, immunomodulator, cardiant, neuroprotective,
XX      antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
XX      ophthalmological, immunomodulatory and cardiovascular activities, and can
XX      be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
XX      can be used for preparing a composition for treating a disease or
XX      condition associated with mPGES-1 e.g., inflammation, Alzheimer's
XX      disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
XX      ophthalmic, immunological, cardiovascular or neurological disorder.

The human mPGES-1 gene is located on chromosome 9, more specifically to 9q34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and

CC inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. mPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.

XX New antisense compound, having a sequence targeted to a nucleic acid
XX encoding mPGES-1, useful for preparing a composition for treating e.g.,
XX inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
XX ischemia.
XX
XX Claim 4; SEQ ID NO 203; 132pp; English.
XX
XX The present sequence represents a chimeric antisense oligonucleotide
XX targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
XX human mPGES-1 gene is located on chromosome 9, more specifically to
XX 9q34.3. The present invention also describes: (1) antisense compounds,
XX having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
XX mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
XX inhibits its expression; (2) a method of inhibiting the expression of
XX mPGES-1 in cells or tissues; and (3) a method of treating an animal
XX having a disease or condition associated with mPGES-1. mPGES-1 chimeric
XX antisense oligonucleotides and antisense compounds have cytostatic,
XX antidiabetic, immunomodulator, cardiant, neuroprotective,
XX antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
XX ophthalmological, immunomodulatory and cardiovascular activities, and can
XX be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
XX can be used for preparing a composition for treating a disease or
XX condition associated with mPGES-1 e.g., inflammation, Alzheimer's
XX disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
XX ophthalmic, immunological, cardiovascular or neurological disorder.

 targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The  
 human mPGES-1 gene is located on chromosome 9, more specifically to  
 9q34.3. The present invention also describes: (1) antisense compounds,  
 CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding  
 mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and  
 CC inhibits its expression; (2) a method of inhibiting the expression of  
 mPGES-1 in cells or tissues; and (3) a method of treating an animal  
 CC having a disease or condition associated with mPGES-1. mPGES-1 chimeric  
 antisense oligonucleotides and antisense compounds have cytostatic,

CC antidiabetic, immunomodulator, cardiant, neuroprotective,  
 CC antiinflammatory, neuroprotective, nontropic, antiarthritic, vasotropic,  
 CC ophthalmological, immunomodulatory and cardiovascular activities, and can  
 CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound  
 CC can be used for preparing a composition for treating a disease or  
 CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's  
 CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or  
 CC ophthalmic, immunological, cardiovascular or neurological disorder.

XX New antisense compound, having a sequence targeted to a nucleic acid  
 encoding mPGEs-1, useful for preparing a composition for treating e.g.,  
 inflammation, Alzheimer's disease, arthritis, diabetes, cancer or  
 ischemia.

XX Claim 4; SEQ ID NO 311; 132pp; English.

XX The present sequence represents a chimeric antisense oligonucleotide  
 targeted to human microsomal prostaglandin E2 synthase (mPGEs-1). The  
 human mPGEs-1 gene is located on chromosome 9, more specifically to  
 9q34.3. The present invention also describes: (1) antisense compounds,  
 having a sequence comprising 8-30 bp targeted to a nucleic acid encoding  
 mPGEs-1, which specifically hybridise with the nucleic acid mPGEs-1 and  
 inhibit its expression; (2) a method of inhibiting the expression of  
 mPGEs-1 in cells or tissues; and (3) a method of treating an animal  
 having a disease or condition associated with mPGEs-1. mPGEs-1 chimeric  
 antisense oligonucleotides and antisense compounds have cytostatic,  
 antidiabetic, immunomodulatory, cardiant, neuroprotective,  
 antiinflammatory, neuroprotective, neurotropic, antiarthritic, vasotropic,

CC ophthalmological, immunomodulatory and cardiovascular activities, and can  
 CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound  
 CC can be used for preparing a composition for treating a disease or  
 CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's  
 CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or  
 CC ophthalmic, immunological, cardiovascular or neurological disorder.

 XX Novel single or multiple target oligonucleotide anti-sense to e.g.  
 PT initiation codon, intron of respiratory disease-relevant gene e.g. CCRL1,  
 PT RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.  
 PT asthma.  
 XX  
 XX Claim 2; SEQ ID NO 1791; 174pp; English.  
 XX  
 CC The invention relates to oligonucleotides anti-sense to an initiation  
 CC codon, coding region, 5' or 3' intron-exon junction, intron or region  
 CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target  
 CC chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)  
 CC -5 receptor, CCRL1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM,  
 CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention  
 CC also relates to a method of screening a candidate compound that binds to  
 CC one or more nucleic acid target(s) or expressed product(s), for the  
 CC prevention and/or treatment of a respiratory or lung disease. The  
 CC oligonucleotides are useful for reducing or inhibiting expression of a  
 CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,  
 CC CCRL1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,  
 CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are  
 CC useful for preventing or treating a respiratory or lung disease. The  
 CC respiratory or lung disease is associated with hyper-responsiveness to  
 CC and/or increased levels of, adenosine and/or levels of adenosine A  
 CC receptor(s), and/or asthma and/or lung allergies associated with  
 CC inflammation or an inflammatory disease. The respiratory or lung disease  
 CC is chosen from airway inflammation, allergy, asthma, impeded respiration,  
 CC cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),  
 CC allergic rhinitis, acute respiratory distress syndrome, pulmonary  
 CC hypertension, lung inflammation, bronchitis, airway obstruction or  
 CC bronchoconstriction. This sequence represents an oligonucleotide of the  
 CC invention.

 XX New library of polynucleotide sequences expressed in cells from synovial  
 PT tissues, useful for diagnosing and treating rheumatoid arthritis or  
 PT osteoarthritis.  
 XX  
 XX Disclosure; SEQ ID NO 5; 71pp; English.  
 XX  
 CC The present invention concerns an analysis of genes differentially  
 CC expressed in synovial tissues from rheumatoid arthritis (RA) and  
 CC osteoarthritis (OA) patients. Microarray technology was used to compare  
 CC gene expression profiles, and sets of genes were identified based on over  
 CC -expression or under-expression in RA samples compared to OA samples.  
 CC Results for 6 of the selected genes (GBPI, CLU, RH70, GLO1, DXS and CTSL)  
 CC were verified by real-time, quantitative PCR using samples identical to  
 CC those used in the microarray experiments and also entirely separate  
 CC samples. The present sequence is that of a forward PCR primer for CLU; a  
 CC reverse primer is also provided ADO07106. CLU was shown to be under-  
 CC expressed in RA relative to OA samples. The invention provides libraries  
 CC and arrays of polynucleotide sequences useful for prognosticating or  
 CC diagnosing RA or OA. Methods are also provided for following the  
 CC efficiency of a treatment against RA or OA, and for screening potential  
 CC therapeutic agents for treating RA or OA.

 PT Reagent, useful for detecting target analyte e.g., nucleic acid,  
 PT comprising particle having bound to at least one Raman label, which can  
 PT be activated to provide surface-enhanced Raman scattering effect, and  
 PT specific binding member.  
 XX  
 PS Disclosure; SEQ ID NO 31; 55pp; English.  
 CC  
 CC The invention describes a reagent (I) comprising a particle bound to at  
 CC least one Raman label and a specific binding member, where the Raman

CC label can be activated to provide a surface-enhanced Raman scattering  
 CC (SERS) effect or comprising a specific binding member having two or more  
 CC different Raman labels bound to it. Also described are: a test kit (II),  
 CC comprising (I) in one container and a silver, gold or copper Raman  
 CC enhancer stain in another container; and a fibre optic detection device  
 CC (III), having a bundle of optical fibres terminating with ends of the  
 CC optical fibre, where a several of the optical fibres have (I) located at  
 CC the ends of the optical fibre. (I) is useful for: detecting for the  
 CC presence or absence of one or more target analytes in a sample, the  
 CC target analytes having at least two binding sites; detecting the presence  
 CC or absence of one or more target nucleic acid in a sample, the sequence  
 CC of the nucleic acid having at least two portions; and for screening one  
 CC or more molecules to determine whether the molecule is a ligand to one or  
 CC more specific receptors. This sequence represents an oligonucleotide  
 CC associated with the SERS-based detection analyte detection method.

 PT Nanoparticles useful for detection and separation of nucleic acids e.g.  
 PT genes associated with disease, in a diagnostic assay, comprise several  
 PT oligonucleotides attached to them.  
 XX  
 PS Example 24; SEQ ID NO 70; 142pp; English.  
 XX  
 CC The invention relates to a method of detecting a nucleic acid with at

CC least two portions by providing a type of nanoparticle-oligonucleotide  
CC conjugate, contacting the nucleic acid and nanoparticles to allow  
CC hybridisation of the oligonucleotides with the two or more portions of  
CC the nucleic acid and observing a detectable change brought about by  
CC hybridisation. The oligonucleotides have a sequence complementary to the  
CC sequence of at least two portions of the nucleic acid. Hybridisation of  
CC the oligonucleotides on the nanoparticles with the nucleic acid results  
CC in a detectable change. The method is used for detection and separation  
CC of nucleic acids (e.g. viral DNA, a gene associated with a disease,  
CC bacterial DNA, fungal DNA, synthetic DNA, structurally-modified DNA, DNA  
CC from biological sources or PCR products) for diagnosis of various  
CC diseases (such as genetic diseases, bacterial infections and viral  
CC infections) and for forensics, DNA sequencing, paternity testing and  
CC monitoring gene therapy. This sequence represents a linking  
CC oligonucleotide of the invention.

DR  
XX Nanoparticles useful for detection and separation of nucleic acids e.g.  
PT genes associated with disease, in a diagnostic assay, comprise several  
PT oligonucleotides attached to them.  
XX  
XX Example 18; SEQ ID NO 55; 142pp; English.  
PS  
XX The invention relates to a method of detecting a nucleic acid with at

CC least two portions by providing a type of nanoparticle-oligonucleotide  
CC conjugate, contacting the nucleic acid and nanoparticles to allow  
CC hybridisation of the oligonucleotides with the two or more portions of  
CC the nucleic acid and observing a detectable change brought about by  
CC hybridisation. The oligonucleotides have a sequence complementary to the  
CC sequence of at least two portions of the nucleic acid. Hybridisation of  
CC the oligonucleotides on the nanoparticles with the nucleic acid results  
CC in a detectable change. The method is used for detection and separation  
CC of nucleic acids (e.g. viral DNA, a gene associated with a disease,  
CC bacterial DNA, fungal DNA, synthetic DNA, structurally-modified DNA, DNA  
CC from biological sources or PCR products) for diagnosis of various  
CC diseases (such as genetic diseases, bacterial infections and viral  
CC infections) and for forensics, DNA sequencing, paternity testing and  
CC monitoring gene therapy. This sequence represents a linking  
CC oligonucleotide of the invention.

XX  
XX Isolating molecules e.g., DNA, by introducing solution with two types of  
PT solute molecules into micro flow path to form non turbulent flow,  
PT providing physical action to molecule causing difference in flow  
PT behavior, separating molecules.  
XX  
XX Example 3; Page 7; 19pp; Japanese.  
XX  
XX The invention relates to a novel method for isolating molecules using a  
CC micro-channel. The molecules are isolated by introducing a mixed solution  
CC having two types of solute molecules differing in molecular weight into a  
CC micro flow path, to form a non turbulent flow, and providing physical  
CC action to the molecules by changing the flow state, thus causing  
CC different behaviours among different solute molecules, where the  
CC different behaviour enables uneven distribution of specific kinds of  
CC molecules in the flow path, causing separation of the molecules. The  
CC invention further comprises: molecule separation apparatus, comprising a

CC substrate with a micro flow path, having one or more curved portions, a  
 CC sample intake unit at one side and a sample removal opening at the other  
 CC side, and a physical property detection sensor arranged inside the curved  
 CC portion or outside the curved portion. The method is useful for isolating  
 CC molecules, e.g. polymer compounds, DNA or proteins. The method enables  
 CC simple and efficient separation of molecules by utilising specific flow  
 CC behaviour in a non turbulent flow, in a micro flow path, where a large  
 CC number of samples can be processed. This polynucleotide sequence  
 CC represents an oligo used in the exemplification of the invention.

PT New microelectronic device designed to carry out and control multi-step
PT and multiplex molecular biological reactions in microscopic format.
XX
PS Example 1; Page 89; 179pp; English.
XX
CC The specification describes a self-addressable, self-assembling
CC microelectronic device which is designed to actively carry out and
CC control multi-step and multiplex molecular biological reactions in
CC microscopic formats. A key aspect of this invention is played by the ion
CC -permeable permeation layer which overlies the electrode. This permeation
CC layer allows attachment of nucleic acids to permit immobilization but
CC also separates the attached oligonucleotides and hybridized target DNA
CC sequences from the highly reactive electrochemical environment generated
CC immediately at the electrode surface. The microelectronic device is
CC designed and fabricated to actively carry out and control reactions such
CC as nucleic acid hybridizations, antibody/antigen reactions, sample
CC preparation, diagnostics and biopolymer synthesis. The device can
CC electronically control the transport and attachment of specific binding
CC entities, such as nucleic acids and polypeptides, to specific micro-
CC locations. The device can subsequently control the transport and reaction
CC of analytes or reactants at the addressed specific micro-locations. The
CC device is able to concentrate analytes and reactants, remove non-
CC specifically bound molecules, provide stringency control for DNA
CC hybridization reactions and improve the detection of analytes. The
CC present sequence represents a probe used to exemplify the invention

PT Sorting single-stranded nucleic acid, useful for analyzing expression
PT patterns and screening active agents, uses capture agent with variable
PT and constant regions.
XX
PS Example; Page 5; 8pp; German.
XX
CC This invention describes a novel method for sorting single-stranded
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then
CC reading out, where the nucleic acids are selectively bound using capture
CC agents that are (a) immobilised on the surface of a solid matrix and (b)
CC comprise variable and non-variable regions. The capture oligonucleotides
CC have a 5'-invariable anchor region, the complement of which is present at
CC least once in each nucleic acid and a 3'-variable, discriminatory region
CC that comprises all possible combinations of up to 10 nucleotides to allow
CC binding of particular sorts of single stranded nucleic acids. The capture
CC agents are particularly locked nucleic acids (LNA) and the anchor region
CC comprises a sequence of 10-50, particularly 15-25, T residues. The
CC capture oligonucleotides are bio-inylated and immobilised on a surface by
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,
CC metal resin, gel, crystalline material and/or membrane, having semi-
CC conducting properties and especially in the form of a chip. Its surface
CC is particularly a layer of (bio)molecular filaments and binding of single
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,
CC hair root, blood, nerve or germ cells and (ii) for determining the
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food
CC additives or supplements, especially minerals, trace elements, organic
CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and
CC mixtures. The method provides rapid, inexpensive and reproducible
CC representation of differences in pools of nucleic acids from cells. It
CC allows imaging of the complete pattern of all nucleic acids in a cell, and
CC can detect very small differences in the nucleic acid pool. Since the
CC method is based on comparison of nucleic acid pools, not individual
CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent

CC binding of particular sorts of single stranded nucleic acids. The capture
CC agents are particularly locked nucleic acids (LNA) and the anchor region
CC comprises a sequence of 10-50, particularly 15-25, T residues. The
CC capture oligonucleotides are biotinylated and immobilised on a surface by
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,
CC metal, resin, gel, crystalline material and/or membrane, having semi-
CC conducting properties and especially in the form of a chip. Its surface
CC is particularly a layer of (bio)molecular filaments and binding of single
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,
CC hair root, blood, nerve or germ cells and (ii) for determining the
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food

```

CC additives or supplements, especially minerals, trace elements, organic  
 CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and  
 CC mixtures. The method provides rapid, inexpensive and reproducible  
 CC representation of differences in pools of nucleic acids from cells. It  
 CC allows imaging of the complete pattern of all nucleic acid in a cell, and  
 CC can detect very small differences in the nucleic acid pool. Since the  
 CC method is based on comparison of nucleic acid pools, not individual  
 CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent  
 CC capture probes used in the method of the invention.

 XX Claim 15; SEQ ID NO 4920; 763pp; English.  
 XX  
 CC This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

XX New achiral linker reagents - useful for incorporation of multiple amino

XX gps. or reporter gps. into oligo:nucleotide(s).

XX Disclosure; Page 20; 42pp; English.

XX Achiral linker reagents have been developed for the incorporation of

CC multiple amino groups into oligonucleotides. The present sequence

CC represents a modified oligodeoxyribonucleotide. The achiral linker

CC reagents can be used for incorporation of multiple primary amino groups

CC or reporter groups into oligonucleotides. They are compatible with

CC conventional DNA synthesis following the phosphoramidite methodology, and

CC labelling of oligonucleotides. They may also be used for preparation of

CC oligonucleotides, e.g. for use as hybridisation probes, for use as

CC primers in the polymerase chain reaction or in nucleic acid sequencing

CC reactions, for production of affinity matrices for purification of DNA

CC binding proteins or other biomolecules, for production of affinity

CC matrices for detection of nucleic acid sequences, for cloning recombinant

CC DNA or for in-vitro mutagenesis

XX Nucleic acid assay methods - based on restriction fragment length

PT determination.

XX Example 1; Page 7; 21pp; English.

XX The present sequence is a DNA probe used in a novel method of analysis or

CC assay for nucleotides, which comprises: (i) digesting DNA with a

CC restriction enzyme; (ii) discriminating a difference in sequences of the

CC DNA fragments obtained around the 3' termini with a DNA probe and

CC extending the DNA probe by a complementary strand synthesis to

CC fractionate the DNA fragments into groups; and (iii) measuring lengths of

CC the DNA fragments which belong to the groups, or length of the extended

CC DNA probe, and using the lengths obtained for the fragments around the 3'

CC termini as fingerprints. Where polyA is present, the presence of

CC recognition sequence GCG is critical for clarifying the terminal site,

CC this is because the length of polyA cannot be controlled. The method is

CC useful for assaying a large number of cDNA molecules or DNA fragments and

CC for assaying long DNA sequences

XX PA (IMMU-) IMMUNOTECH SA.  
 XX PI Lopez RA;  
 XX XX WPI; 2004-053333/05.  
 XX PT New immunostimulatory oligonucleotide comprising non-palindromic nucleic  
 PT acid sequence motif, useful for inducing B-cell activation, treating,  
 PT preventing or ameliorating immune system disorder or tumoral disease e.g.  
 XX melanoma.  
 XX PS Disclosure; Fig 3; 139pp; English.  
 XX CC This invention relates to novel immunostimulatory oligonucleotides that  
 CC contain a non-palindromic sequence motif. Specifically, it refers to DNA  
 CC oligonucleotides (without a CpG motif), which can stimulate an immune  
 CC response in animals of the order of primate, including humans. The immune  
 CC response is characterised by the proliferation, differentiation, cytokine  
 CC and antibody production in B-cells, as well as cell differentiation and  
 CC cytokine production in plasmacytoid dendritic cells. The present  
 CC invention describes immunomodulator compositions that also comprise an  
 CC antigen selected from, for example, viruses, bacteria, parasites, tumour  
 CC cells and glycolipids. As such, these DNA oligos can be used in gene  
 CC therapy for inducing B-cell activation, treating, preventing or  
 CC ameliorating an immune system disorder or a tumoral disease including  
 CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell  
 CC carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG  
 CC variant DNA oligo, used in an exemplification of the invention.

XX PT New foam protein from cereals useful for improving foam formation,  
 PT stability and half-life in foaming products such as beverages and  
 XX especially beer.  
 XX PS Example 6; Page 22; 82pp; English.  
 XX CC The present sequence represents a primer used to reverse transcribe mRNA  
 CC encoding the barley 17 kDa foam protein. The protein has foam enhancing  
 CC properties, and belongs to the prolamin storage protein family. It is  
 CC found in the endosperm tissue of mature cereal grain, and is synthesised  
 CC during grain development. The 17 kDa foam protein can be added to  
 CC products, e.g. foaming beverages such as beer, to enhance the foaming  
 CC quality of the product. The protein can be used to produce improved  
 CC brewed products. The proteins and polynucleotides are especially useful  
 CC for improving the formation, stability and half-life of the foam head on  
 CC beer. The antibodies are useful to detect, measure and purify the  
 CC proteins in samples such as transgenic cells/plants and foaming products

Clusterin and gp38K-related peptide capable of altering cell migration
useful for treating atherosclerosis, cancer and stenosis following
vascular trauma or disease.
XX
XX Disclosure; Page 12; 43pp; English.
XX
XX The present sequence is a PCR primer for the murine clusterin gene.
XX Clusterin (also known as complement cytotoxicity inhibitor, sulfated
XX glycoprotein-2, testosterone repressed prostate message-2, SP-40, 40 and
XX apoJ) is essential for the migration of vascular smooth muscle cells
XX (VSMC). The gene and protein can, therefore, be used to promote wound
XX healing, angiogenesis and vasculogenesis, in the treatment of stenosis
XX following vascular trauma or disease and to treat atherosclerosis, and
XX antiseize sequences can be used to treat cancer, as angiogenesis is vital
XX for tumour survival

XX Identifying a candidate polymorphic repeat within a coding sequence, for  
 PT understanding or treating genetic disease, comprises detecting tandem  
 PT repeats in a target coding sequence and scoring the repeats for  
 PT polymorphic probability.

XX Example; Col 495; 588pp; English.

XX The invention discloses a method for identifying a candidate polymorphic  
 CC repeat within a coding sequence (expressed sequence tag, EST) which  
 CC comprises detecting tandem repeats in a target coding sequence, scoring  
 CC the repeats for polymorphic probability and generating a dataset  
 CC correlating the repeats with polymorphic probability to identify a  
 CC candidate polymorphic repeat. The computational probability to identify a  
 CC marker prediction of ubiquitous simple sequences (POMPOUS, and Rep-X) are  
 CC useful for identifying and detecting candidate polymorphic repeats in  
 CC human genes, which can be used to understand, treat or eliminate genetic  
 CC diseases, predispositions or adverse drug-treatment reactions. Examples  
 CC of diseases linked to nucleotide repeats are Machado-Joseph, Haw River  
 CC syndrome, Huntington's disease, fragile-X syndrome, Friedrich's ataxia,  
 CC myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and  
 CC spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are  
 CC the polymorphic repeats identified for a search of human ESTs

XX Sorting single-stranded nucleic acid, useful for analyzing expression  
 PT patterns and screening active agents, uses capture agent with variable  
 PT and constant regions.

XX Example; Page 5; 8pp; German.

XX This invention describes a novel method for sorting single-stranded  
 CC nucleic acids by isolation and hybridisation of nucleic acid pools, then  
 CC reading out, where the nucleic acids are selectively bound using capture  
 CC agents that are (a) immobilised on the surface of a solid matrix and (b)  
 CC comprise variable and non-variable regions. The capture oligonucleotides  
 CC have a 5'-invariable anchor region, the complement of which is present at  
 CC least once in each nucleic acid and a 3'-variable, discriminatory region  
 CC that comprises all possible combinations of up to 10 nucleotides to allow  
 CC binding of particularly sorted single stranded nucleic acids. The capture  
 CC agents are particularly locked nucleic acids (LNA) and the anchor region  
 CC comprises a sequence of 10-50, particularly 15-25, T residues. The  
 CC capture oligonucleotides are biotinylated and immobilised on a surface by  
 CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,  
 CC metal, resin, gel, crystalline material and/or membrane, having semi-  
 CC conducting properties and especially in the form of a chip. Its surface  
 CC is particularly a layer of (biomolecular filaments and binding of single  
 CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,  
 CC physical, stimulated by an electrical field or through a molecular sieve.  
 CC The method is used (i) for analysis of patterns, especially in mucosal,  
 CC hair root, blood, nerve or germ cells and (ii) for determining the  
 CC activity of pharmaceuticals and/or nutritional compounds, e.g. food  
 CC additives or supplements, especially minerals, trace elements, organic  
 CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and  
 CC mixtures. The method provides rapid, inexpensive and reproducible  
 CC representation of differences in pools of nucleic acids from cells. It  
 CC allows imaging of the complete pattern of all nucleic acid in a cell, and  
 CC can detect very small differences in the nucleic acid pool. Since the  
 CC method is based on comparison of nucleic acid pools, not individual  
 CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent  
 CC capture probes used in the method of the invention.

 CC activity of pharmaceuticals and/or nutritional compounds, e.g. food  
 CC additives or supplements, especially minerals, trace elements, organic  
 CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and  
 CC mixtures. The method provides rapid, inexpensive and reproducible  
 CC representation of differences in pools of nucleic acids from cells. It  
 CC allows imaging of the complete pattern of all nucleic acids in a cell, and  
 CC can detect very small differences in the nucleic acid pool. Since the  
 CC method is based on comparison of nucleic acid pools, not individual  
 CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent  
 CC capture probes used in the method of the invention.

 PT and constant regions.  
 XX

PS Example; Page 5; 8pp; German.

XX This invention describes a novel method for sorting single-stranded  
 CC nucleic acids by isolation and hybridisation of nucleic acid pools, then  
 CC reading out, where the nucleic acids are selectively bound using capture  
 CC agents that are (a) immobilised on the surface of a solid matrix and (b)  
 CC comprise variable and non-variable regions. The capture oligonucleotides  
 CC have a 5'-invariable anchor region, the complement of which is present at  
 CC least once in each nucleic acid and a 3'-variable, discriminatory region  
 CC that comprises all possible combinations of up to 10 nucleotides to allow  
 CC binding of particular sorts of single stranded nucleic acids. The capture  
 CC agents are particularly locked nucleic acids (LNA) and the anchor region  
 CC comprises a sequence of 10-50, particularly 15-25, T residues. The  
 CC capture oligonucleotides are biotinylated and immobilised on a surface by  
 CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,  
 CC metal, resin, gel, crystalline material and/or membrane, having semi-  
 CC conducting properties and especially in the form of a chip. Its surface  
 CC is particularly a layer of (bio)molecular filaments and binding of single  
 CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,

CC metal, resin, gel, crystalline material and/or membrane, having semi-  
 CC conducting properties and especially in the form of a chip. Its surface  
 CC is particularly a layer of (bio)molecular filaments and binding of single  
 CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,  
 CC physical, stimulated by an electrical field or through a molecular sieve.  
 CC The method is used (i) for analysis of patterns, especially in mucosal,  
 CC hair root, blood, nerve or germ cells and (ii) for determining the  
 CC activity of pharmaceuticals and/or nutritional compounds, e.g. food

XX PT Sorting single-stranded nucleic acid, useful for analyzing expression  
XX PT patterns and screening active agents, uses capture agent with variable  
XX PT and constant regions.  
XX PS Example; Page 5; 8pp; German.  
XX CC This invention describes a novel method for sorting single-stranded  
XX CC nucleic acids by isolation and hybridisation of nucleic acid pools, then  
XX CC reading out, where the nucleic acids are selectively bound using capture  
XX CC agents that are (a) immobilised on the surface of a solid matrix and (b)  
XX CC comprise variable and non-variable regions. The capture oligonucleotides  
XX CC have a 5'-invariable anchor region, the complement of which is present at  
XX CC least once in each nucleic acid and a 3'-variable, discriminatory region  
XX CC that comprises all possible combinations of up to 10 nucleotides to allow  
XX CC binding of particular sorts of single stranded nucleic acids. The capture  
XX CC agents are particularly locked nucleic acids (LNA) and the anchor region  
XX CC comprises a sequence of 10-50, particularly 15-25, T residues. The  
XX CC capture oligonucleotides are biotinylated and immobilised on a surface by  
XX CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,  
XX CC metal, resin, gel, crystalline material and/or membrane, having semi-  
XX CC conducting properties and especially in the form of a chip. Its surface  
XX CC is particularly a layer of (bio)molecular filaments and binding of single  
XX CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,  
XX CC physical, stimulated by an electrical field or through a molecular sieve.  
XX CC The method is used (i) for analysis of patterns, especially in mucosal,  
XX CC hair root, blood, nerve or germ cells and (ii) for determining the  
XX CC activity of pharmaceuticals and/or nutritional compounds, e.g. food  
XX CC additives or supplements, especially minerals, trace elements, organic  
XX CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and  
XX CC mixtures. The method provides rapid, inexpensive and reproducible  
XX CC representation of differences in pools of nucleic acids from cells. It  
XX CC allows imaging of the complete pattern of all nucleic acids in a cell, and  
XX CC can detect very small differences in the nucleic acid pool. Since the  
XX CC method is based on comparison of nucleic acid pools, not individual  
XX CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent  
XX CC capture probes used in the method of the invention.

PT polynucleotides, used to confer triasulfuron herbicide resistance to
PT plants.
XX
XX Example 1c; Page 52; 77pp; English.
PS
XX The present sequence is the oligo (dT) non-degenerate RT-PCR primer, 3'PC
CC -1, complementary to the poly(A) tract of the CYP71C3v2 mRNA. It is used
CC to extract and amplify mRNA isolated from naphthalic anhydride-treated
CC maize seedlings. The CYP71C3v2 gene is mapped to a single locus on the
CC short arm of maize chromosome 4 (4p). CYP71C3v2 reductively cleaves
CC molecular dioxygen to produce functionalised organic substrates. It has
CC herbicidal activity. CYP71C3v2 polynucleotides are used to produce
CC transgenic organisms, such as yeast, plants and bacteria that are
CC resistant to herbicides, such as triasulfurons. Undesired vegetation,
CC e.g. weed, pigweed, velvet leaf, labs quarters, Chenopodium album and
CC quack grass, can easily be controlled when such transgenic plants are
CC grown. Transformed organisms can also be used to identify compounds with
CC herbicidal activity

PT from it.
PT
XX
XX Example 6; Page 42; 385pp; English.
PS
XX
XX The invention relates to a mammalian PGI gene and protein, and a set of
CC PGI biallelic markers. The PGI polynucleotide and biallelic markers are
CC used in a hybridisation assay, a sequencing assay, or in an allele-
CC specific amplification assay for determining the identity of a nucleotide
CC at a PGI-related biallelic marker. The methods can be used to detect and
CC to assess the risk of developing cancer or prostate cancer. Early-stage
CC diagnosis of prostate cancer relies on prostate specific antigen (PSA)
CC dosage. However, the effectiveness of this is limited due to its
CC inability to discriminate between malignant and non-malignant affections
CC of the organ. A need exists for both a reliable diagnostic procedure
CC which would enable early-stage diagnosis and for preventative and
CC curative treatments of the disease. The PGI gene can be used for
CC detection of prostate cancer, and the risk of developing it in the
CC future, and can also be used to determine therapies for the disease

XX Novel nucleic acid comprising a locked nucleic acid unit having a
XX modified base that comprises an optionally substituted carbocyclic aryl
XX moiety, or modified nucleobase or nucleosidic base other than
XX oxazole/imidazole.
XX Example 24a; Page 90; 119pp; English.
XX The present sequence is that of pyrene-anchored locked nucleic acid (LNA)
XX oligo(dT) primer ON12, which was used in first-strand cDNA synthesis from
XX eukaryotic mRNA. It includes compound '17d' at its 3' end, which is based
XX on an LNA-type 2'-O,4'-C-methylene-beta-D-ribofuranosyl moiety. It is
XX one of a set of such primers (see also ACC48483-85) that were used in an
XX example from the invention to demonstrate improved reverse transcription
XX of mRNA using pyrene-LNA anchored oligo(T) primers. The following results
XX were observed: efficient priming on mRNAs with short poly(A) tails;
XX efficient anchoring of the oligo(T) primer by pyrene-LNA and LNA-C/G/T
XX units resulting in an improved T20-VN anchor primer and thus avoiding
XX reverse transcription of long poly(A) tracts; and improved reverse
XX transcription of eukaryotic poly(A)+RNA directly from total RNA extracts
XX due to increased specificity. The invention relates to modified LNA units
XX that comprise unique base groups. Desirable nucleobase and nucleosidic
XX base substitutions can mediate universal hybridisation when incorporated
XX into nucleic acid strands. The novel LNA compounds can be used e.g. as
XX PCR primers, in sequencing, the synthesis of antisense oligonucleotides,
XX and in diagnostics

XX Determining the relative copy number of a group of target nucleic acid
  molecules present in a sample by performing a first or second PCR in a
  PCR mixture and quantifying the number of copies of the second target
  nucleic acid product.
PS
XX Example 1; Page 68; 118pp; English.
XX
XX The present invention describes a multiplex real-time quantitative PCR
  method for determining the relative copy number of a group of target
  nucleic acid molecules present in a sample. The method comprises: (1)
  performing a first PCR in a PCR mixture; (2) performing a second PCR in a
  PCR mixture; and (3) quantifying the number of copies of the second
  target nucleic acid product present in the sample containing the target
  nucleic acid molecule. Also described: (1) quantifying the copy number of
  a group of target nucleic acids in a sample; and (2) determining whether
  a subject is at risk of acquiring Alzheimer's disease. The method is
  useful for determining the relative copy number of a group of target
  nucleic acid molecules present in a sample for determining whether a
  subject is at risk of acquiring Alzheimer's disease. ACC99620 to ACC99730

XX
XX The present invention relates to a method for stimulating an immune
  response. The method comprises administering an immunostimulatory nucleic
  acid to a non-rodent subject in sufficient quantity to stimulate an
  immune response. The present sequence is one such immunostimulatory
  nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
  (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
  against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
  and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
  haemophilus, campylobacter, clostridium, Escherichia coli and/or
  staphylococcus), fungal antigens and/or parasitic antigens. The method is
  also useful for preventing cancer, asthma, infectious disease, allergy or
  immune deficiency. The present sequence can also be used to redirect a
  Th2 to a Th1 immune response and to activate immune cells. Note: the
  present sequence may have a phosphorothioate backbone

XX This invention relates to novel immunostimulatory oligonucleotides that
CC contain a non-palindromic sequence motif. Specifically, it refers to DNA
CC oligonucleotides (without a CpG motif), which can stimulate an immune
CC response in animals of the order of primate, including humans. The immune
CC response is characterised by the proliferation, differentiation, cytokine
CC and antibody production in B-cells, as well as cell differentiation and
CC cytokine production in plasmacytoid dendritic cells. The present
CC invention describes immunomodulator compositions that also comprise an
CC antigen selected from, for example, viruses, bacteria, parasites, tumour
CC cells and glycolipids. As such, these DNA oligos can be used in gene
CC therapy for inducing B-cell activation, treating, preventing or
CC ameliorating an immune system disorder or a tumoural disease including
CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell
CC carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG
CC variant DNA oligo, used in an exemplification of the invention.

The sequences given in AAT10742-67 are synthetic oligonucleotides which are used in the construction of the electronically self-addressable device (ED) of the invention. The ED comprises a substrate, an electrode or opt. a number of electrodes supported by the substrate, a current source operatively connected to the electrode and an attachment layer permeable to a molecule which is permeable to a counterion but not adjacent to the electrode. The attachment layer is capable of binding to the electrode. The ED is used for genetic typing and comprises a macromolecule. The ED is used for genetic typing and comprises a number of electronically addressable locations each comprising an electrode, and a binding entity, such as one of these probes, attached to each of the locations capable of detecting the presence of a genetic sequence

New aminoxy-modified oligonucleotides - which can show improved binding to complementary strands and improved resistance to nuclease.  
Disclosure; Page 84; 131pp; English.  
The invention relates to aminoxy-modified(oligo)nucleotides or nucleosides which are useful as therapeutics, diagnostics, and research reagents. They may be used, e.g., for modulation of the ras gene and may be able to modulate the process of transformation from normal to malignant cell growth. They may be prepared using known methods.

Inclusion of the aminoxy moieties can improve binding of oligonucleotides to complementary strands. The moieties can also provide conjugation sites useful for conjugation of useful ligands (e.g. reporter groups and groups for modifying uptake, distribution or other pharmacodynamic properties) to oligonucleotides. The present sequence represents an example of an aminoxy-modified oligonucleotide disclosed in the specification

XX New microelectronic device designed to carry out and control multi-step  
 PT and multiplex molecular biological reactions in microscopic format.  
 PT  
 XX Example 1; Page 90; 179pp; English.  
 PS

XX The specification describes a self-addressable, self-assembling  
 CC microelectronic device which is designed to actively carry out and  
 CC control multi-step and multiplex molecular biological reactions in  
 CC microscopic formats. A key aspect of this invention is played by the ion  
 CC -permeable permeation layer which overrules the electrode. This permeation  
 CC layer allows attachment of nucleic acids to permit immobilization but  
 CC also separates the attached oligonucleotides and hybridized target DNA  
 CC sequences from the highly reactive electrochemical environment generated  
 CC immediately at the electrode surface. The microelectronic device is  
 CC designed and fabricated to actively carry out and control reactions such  
 CC as nucleic acid hybridizations, antibody/antigen reactions, sample  
 CC preparation, diagnostics and biopolymer synthesis. The device can  
 CC electronically control the transport and attachment of specific binding  
 CC entities, such as nucleic acids and polypeptides, to specific micro-  
 CC locations. The device can subsequently control the transport and reaction  
 CC of analytes or reactants at the addressed specific micro-locations. The  
 CC device is able to concentrate analytes and reactants, remove non-  
 CC specifically bound molecules, provide stringency control for DNA  
 CC hybridization reactions and improve the detection of analytes. The  
 CC present sequence represents a probe used to exemplify the invention

XX An enzyme-specific cleavable polynucleotide substrate bearing quenched  
 PT fluorescent moieties.  
 PT  
 XX Example 2; Page 20; 34pp; English.  
 PS

XX The specification describes an enzyme-specific cleavable polynucleotide  
 CC substrate bearing quenched fluorescent moieties. The enzyme-specific  
 CC cleavable polynucleotide substrate is useful in biological assays for  
 CC detection and identification of microorganisms, sterilization assurance,  
 CC pharmaceutical discovery, enzyme assays, immunoassays and other  
 CC biological assays. The method provides a rapid and convenient approach  
 CC for detection and identification of microorganisms. It can be adapted to  
 CC sequence-dependent or sequence-independent tests. The invention provides  
 CC improved accuracy, faster detection, and overall lower cost in detection  
 CC and identification of microorganisms. The presence of nuclease is  
 CC measured more accurately and sensitively by red-shifting the emission  
 CC wavelength from far UV region (350-400 nm) to the 500-600 nm region of  
 CC the electromagnetic spectrum and reducing the effect of background signal

CC levels of intact reagents. The present sequence is used in the course of  
 CC the invention

Cohen D, Blumenfeld M, Chumakov I, Bougueleret L;  
 WPI; 1999-405178/34.  
 Use of a prostate cancer associated gene and biallelic markers derived from it.  
 Claim 4; Page 374; 385pp; English.  
 The invention relates to a mammalian PGI gene and protein, and a set of PGI biallelic markers. The PGI polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a nucleotide at a PGI-related biallelic marker. The methods can be used to detect and assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PGI gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease

XX Disclosure; Page 51; 60pp; English.  
PS  
XX The present sequence represents an oligomeric compound containing 2'-O-  
CC modified ribosyl nucleosides. The oligomeric compound contains  
CC phosphodiester linkages. The 2'-O-modified nucleosides include ring  
CC structures that position the sugar moiety of the nucleosides  
CC preferentially in 3' endo geometries. The modified oligomeric compounds  
CC have increased binding affinity and increased nuclease resistance. The  
CC oligomeric compounds can be used in diagnostic, therapeutic and research  
CC reagents

```

```

XX CC The invention relates to aminoxy-modified nucleosides and
CC oligonucleotides and to oligonucleotides that elicit RNase H for cleavage
CC in a complementary nucleic acid strand. It also relates to
CC oligonucleotides wherein at least some of the nucleotides are
CC functionalised to be nuclease resistant, at least some of the nucleotides
CC include a substituent that potentiates hybridisation of the
CC oligonucleotide to a complementary strand, and at least some of the
CC nucleotides include a 2'-deoxy-erythro-pentofuranosyl sugar moiety. The
CC inclusion of one or more aminoxy moieties in such oligonucleotides
CC provides for improved binding of such oligonucleotides to a complementary
CC strand. The oligonucleotides of the invention are used as diagnostic,
CC therapeutic or research reagents, and can be used to modulate gene
CC expression in organisms. The oligonucleotides containing the modified
CC nucleosides have increased nuclease resistance and increased binding
CC affinity to a complementary strand. The present sequence represents an
CC oligonucleotide containing nucleotides substituted with a 2'-O-(2-[N-(2-
CC amino)ethyl-N-(methyl)aminoxyethyl] group

PT Novel method for the production of oligomers with reduced exocyclic
PT adducts comprises treatment with deprotecting and cleaving reagents.
XX
XX
PS Example 2; Page 17; 33pp; English.
XX
CC This invention describes a novel synthetic method (M) comprising: (a)
CC providing a sample comprising a number of oligomers of formula (i); (b)
CC contacting the sample with a deprotecting agent to remove R t groups from
CC the oligomers; and (c) reacting the oligomer with a cleaving reagent. The
CC method is used to produce oligomeric compounds for use in antisense and
CC oligonucleotide therapies. The method enables the synthesis of oligomers
CC with a reduction in the number acrylonitrile groups attached.
CC Acrylonitrile has been demonstrated to be a potent carcinogen in rats.
CC This sequence represents a phosphorothioate 20-mer primer which is used
CC in the method of the invention

PT Detaching nucleic acid molecule comprising unconventional nucleotide
PT incorporated at predetermined site from a solid support involves cleaving
PT the nucleic acid molecule at the site of unconventional nucleotide.
XX
XX
PS Example 3; Page 34; 47pp; English.
XX
CC The present invention is concerned with the cleavage of nucleic acids
CC from solid supports. This is carried out by adding a non-conventional
CC nucleotide into the nucleic acid attached to the support, so that it is
CC recognised and cleaved by a specific DNA glycosylase and the sequence is
CC released. This is useful in many molecular biological procedures such as
CC sequencing, in vitro amplifications, cDNA and template preparation, DNA-
CC based assays, mutagenesis procedures, nucleic acid purification and
CC affinity chromatography. The present sequence is an oligonucleotide used
CC in assays to demonstrate the methods of the invention

PT New 2'-O-acetamido modified nucleosides (I) used to produce
PT oligonucleotides which have enhanced nuclease resistance and superior
PT hybridization properties than prior art.
XX
PS Example 12; Col 28; 29pp; English.
XX
CC The present sequence is a modified oligonucleotide. 2'-O-acetamido-
CC modified nucleosides were used to produce oligonucleotides which have
CC enhanced nuclease resistance and superior hybridisation properties than
CC prior art. The oligomeric compounds are useful for identification or
CC quantification of ribonucleic acid and deoxyribonucleic acid or for
CC modulating the activity of an ribonucleic acid or deoxyribonucleic acid
CC molecule. They have a modified nucleoside monomer and are specifically
CC hybridisable with a preselected nucleotide sequence of a single-stranded
CC or double-stranded target deoxyribonucleic acid or ribonucleic acid
CC molecule. The oligomers are further useful in a ras-luciferase fusion
CC system using ras-luciferase transactivation. They are useful in abnormal
CC cell proliferation and tumour formation and modulation of expression of
CC protein kinase C and cell adhesion molecules such as ICAM. They are
CC useful in the modulation of proteins related to multidrug resistance and
CC viral genomic nucleic acids such as HIV, herpes viruses, Epstein-Barr
CC virus, cytomegalovirus, papillomavirus, hepatitis C virus and influenza
CC virus

XX
CC The present invention relates to a method for the qualitative and
CC quantitative detection of targets in a sample by molecular interaction
CC between the target and probes in an array. The method can be used to
CC detect interactions between nucleic acids, antigens and antibodies or
CC receptor and ligands, particularly in applications such as medical
CC diagnosis, forensic science, bacterial screening, tissue typing for
CC transplantation, monitoring gene expression, and genotyping. The present
CC sequence is a modifying oligonucleotide used in the exemplification of
CC the invention

 XX Identifying and detecting nucleic acids, particularly DNA hybridization  
 XX probes, involves employing chain extending enzymes (e.g. telomerase) to  
 XX elongate probes to render them readily detectable.  
 XX Example 1; Page 5; 10pp; English.  
 XX The present invention describes a method for detecting a nucleic acid  
 XX probe, which comprises using chain extending enzymes to elongate probes.  
 XX The method comprises: (a) treating the sample with a chain terminating  
 XX reagent to prevent polynucleotide chain growth from the nucleic acid in  
 XX the sample; (b) contacting the sample with the probe containing a  
 XX terminus capable of elongation by a chain extending enzyme, where the  
 XX probe hybridises to the nucleic acid in the sample; (c) contacting the  
 XX sample with a chain extending enzyme and its substrates, which elongates  
 XX the probe; and (d) detecting the elongated hybridised probe. Also  
 XX described is a method comprising: (a) treating nucleic acid molecules or  
 XX modified nucleic acids in a sample with a reagent or reagents that render  
 XX the nucleic acid chains unextendable by a non-template-dependent enzyme;  
 XX (b) hybridising the treated molecules with a nucleic acid probe that  
 XX includes an extendable terminus, under conditions where hybrids form; and  
 XX (c) treating any hybrids formed with a non-template dependent chain  
 XX elongating enzyme and its substrates, where any hybridised probe is  
 XX extended. The method is useful for identifying and detecting nucleic  
 XX acids, particularly DNA hybridisation probes. The present sequence  
 XX represents a tailing reaction exemplary primer, which is used in an  
 XX example from the present invention

XX Increasing binding of oligomeric compound to proteins useful in
XX preparation of antisense therapeutics, involves use of modified
XX oligomeric compound having oligonucleotide group.
XX
XX Example 27; Page 72; 122pp; English.
XX
XX The present sequence is an example of an oligonucleotide of the invention
XX containing 2'-O-(2-(methylthio)ethyl)-5-methyluridine (2'-O-(MTE)-5-
XX methyluridine) modifications. In examples of the invention, 2'-O-MTE was
XX incorporated into oligonucleotides and evaluated for antisense properties
XX in comparison with the known 2'-O-(2-methoxyethyl) (2'-O-MOE)
XX modification. The 2'-O-MTE modified oligonucleotides exhibited similar
XX binding affinity to target RNA as their 2'-O-MOE equivalent while binding
XX to human serum albumin was improved. The modification can be used to
XX modulate the pharmacokinetics of oligonucleotides, e.g. in antisense
XX therapy

XX
XX New oligonucleotide comprising at least one 2',5'-internucleotide linkage
PT useful for treating organisms having disease caused by undesired
PT production of protein e.g. bacteria, yeast, protozoa and algae.
XX
XX Example 54; SEQ ID NO 6; 30pp; English.
PS
XX The invention describes an oligonucleotide comprising several nucleotides
CC covalently linked together by internucleotide linkages. At least one of
CC the nucleotides is linked to an adjacent nucleotide by 2',5'-
CC internucleotide linkage and bears a 3'-substituent. The oligonucleotides
CC are useful; as antisense oligonucleotides; in pharmaceutical compositions
CC ; for treating organisms having disease caused by undesired production of
CC protein e.g. organism that utilises RNA-DNA transcription or RNA-protein
CC translation, bacteria, yeast, protozoa, algae and warm-blooded animals;
CC for developing diagnostic and therapeutic agents. The modified
CC oligonucleotide exhibits improved properties of nuclease resistance and
CC binding affinity. The oligonucleotides are easy to synthesise and exhibit
CC good properties of nuclease resistance and hybridisation to target
CC nucleic acids. The oligonucleotide is potent antisense agent with longer
CC duration of action. This sequence represents an oligonucleotide of the
CC invention.

 XX  
 CC The present sequence is the sense strand of a short interfering RNA  
 CC (siRNA) targeted to a specific portion ADL70521 of human clusterin cDNA.  
 CC The antisense strand is also provided ADL70523. The siRNA can be used to  
 CC interfere with the expression of clusterin. Clusterin, also known as  
 CC testosterone-repressed prostate message-2 (TRPM-2) or sulfated  
 CC glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate  
 CC tumour cells following androgen withdrawal, and has also been shown to be  
 CC critical for neuritic toxicity in mouse models of Alzheimer's disease.  
 CC siRNAs of the invention can be used alone or in combination with other

CC other nanoparticles, forming one or more coated nanotubes. (I) can be  
 CC used as a biosensor for detecting complementary nucleic acid strands,  
 CC useful in clinical application for screening presence of bacterial or  
 CC viral nucleic acid, in pharmaceutical applications, agricultural  
 CC applications, food control, hygiene and environmental monitoring and  
 CC forensic applications. (II) is useful as a nano-scale conductor or  
 CC semiconductor, more specifically as a component in nano-electronic  
 CC applications, as a replacement for damaged nerves in prosthetic  
 CC applications, or as the bio-electronic interface in bio-electronic  
 CC devices. (II) can also be used as a transistor or gated device. The  
 CC present sequence represents an oligonucleotide which is used in an  
 CC example from the present invention.

An isolated nucleic acid molecule, comprising nucleic acid sequence of
Nicotiana derived cytochrome P450 enzyme fragments, useful for producing
transgenic plants.
XX
Disclosure; SEQ ID NO 154; 82pp; English.
XX
The invention relates to an isolated nucleic acid molecule (I),
comprising a nucleic acid sequence chosen from 75 Nicotiana-derived
cytochrome P450 enzyme fragment sequences. (I) is useful for producing a
transgenic tobacco plant, which involves operably linking (I) with a
promoter functional in the plant to create a plant transformation vector,
and transforming the plant with the plant transformation vector,
selecting a plant cell transformed with the transformation vector, and
regenerating a plant from the selected plant cell. The nucleic acid
molecule is in an antisense orientation, sense orientation or is in a RNA
interference orientation. The present sequence represents a PCR primer
used to clone DNA encoding tobacco cytochrome P450 enzyme fragments of
the invention.

 PA Manoharan M, Bumcrot D;  
 PI WPI; 2004-677362/66.  
 DR Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 6759; 378pp; English.  
 PS The invention describes a RNA interference (iRNA) agent (I) comprising a  
 XX sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instructions for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a hepatitis C virus (HCV) antisense oligonucleotide that can  
 CC be used to control HCV gene expression.

 XX (ALNY-) ALNYLAM PHARM.  
 PA Manoharan M, Bumcrot D;  
 PI WPI; 2004-677362/66.  
 DR Interference RNA agent useful for treating dyslipidemias, coronary artery  
 XX disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 6756; 378pp; English.  
 PS The invention describes a RNA interference (iRNA) agent (I) comprising a  
 XX sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instructions for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a hepatitis C virus (HCV) antisense oligonucleotide that can  
 CC be used to control HCV gene expression.  
 XX

XX PT primitive progenitor cells, esp. for treating disorders involving blood
XX PT cells.
XX PS
XX PS Example 3; Fig 12C; 127pp; English.
XX CC
XX CC AAT04915-T04922 are oligonucleotide primers and probes used for the
XX CC amplification and sequencing of mammalian stem cell factor (SCF). Non-
XX CC naturally occurring SCF and C-terminally truncated polypeptides, having
XX CC amino acid sequences sufficiently duplicative of naturally occurring SCF,
XX CC stimulate growth of primitive progenitors such as haematopoietic
XX CC progenitor cells, neural stem cells and primordial germ stem cells. The
XX CC peptides can be used in a composition for treating leucopenia, anaemia or
XX CC thrombocytopenia, for enhancing engraftment of bone marrow during
XX CC transplantation or for bone marrow recovery after chemotherapy or
XX CC radiation-induced bone marrow aplasia or myelosuppression. They can also
XX CC be used for treating neoplasia, nerve damage, infertility, intestinal
XX CC damage or myeloproliferative disorders. Antibodies may be raised against
XX CC the peptides for use in detection or neutralisation of SCF in serum. SCF
XX CC may be useful for the treatment of AIDS and severe combined
XX CC immunodeficiency (SCID) states alone or in combination with other factors
XX CC such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)

XX
PT Production of hematopoietic cells suitable for administration to a
PT subject using progenitor cells and expanding the cells using stem cell
PT factor.
XX
XX
PS Example 3; Fig 12C; 123pp; English.
XX
CC A method has been developed of making haematopoietic cells suitable for
CC administration to a subject. The method comprises: (a) obtaining
CC haematopoietic progenitor cells from a donor; and (b) expanding the cells
CC by adding to the cells a haematopoietically effective dose of a
CC polypeptide product having at least part of the primary structural
CC confirmation and one or more of the biological properties of naturally
CC occurring stem cell factor (SCF). The method is useful for stimulating
CC primitive progenitor cells including early haematopoietic progenitor
CC cells which are capable of maturing to erythroid, megakaryocyte,
CC granulocyte, lymphocyte and macrophage cells. SCF results in absolute
CC increases in haematopoietic cells of both myeloid and lymphoid lineages.
CC SCF is useful for treating haematopoietic disorders. The method is useful
CC for expanding early haematopoietic progenitors in syngeneic, allogeneic
CC or autologous bone marrow transplant. SCF is useful for enhancing the
CC efficiency of gene therapy based on transfecting haematopoietic stem
CC cells. SCF is also useful for combating the myelosuppressive effects of
CC anti-HIV drugs such as AZT and for enhancing haematopoietic recovery
CC after acute blood loss and as a boost to the immune system for fighting
CC neoplasia (cancer). The present sequence represents a universal
CC oligonucleotide which is used in an example from the present invention

XX
XX Enhancing efficiency of transfer of polynucleotide into a target
PT mammalian cell in vitro, involves exposing cell that expresses a stem
PT cell factor receptor to stem cell factor, and introducing polynucleotide
PT into cell in vitro.
XX
XX Example 3; Fig 12C; 210pp; English.
PS
CC The present invention describes a method for enhancing (E) the efficiency
CC of transfer of a polynucleotide (I) into a target mammalian cell (II) in
CC vitro, comprising exposing (II) that expresses a stem cell factor (SCF)
CC receptor to a biologically active SCF, its analogue or fragment, which
CC induces cell proliferation, and introducing (I) to (II) in vitro.
CC Exposure of SCF to (II) results in increased uptake of (I) into the cell.
CC The method is useful for enhancing the efficiency of the transfer of a
CC polynucleotide into a target mammalian cell in vitro. The method is
CC useful in gene therapy techniques. AAH41301 to AAH41364 and AAB98351 to
CC AAB98390 represent sequences used in the exemplification of the present
CC invention

PT	New non-natural stem cell factor, useful for treating e.g. leucopenia or
PT	immune deficiency, also related nucleic acid and antibodies.
XX	
PS	Disclosure; SEQ ID NO 34; 217pp; English.
XX	
CC	The invention relates to stem cell factor (SCF) polypeptides with
CC	haematopoietic activity and the polynucleotides encoding them. The
CC	polypeptides are used for treating infertility, intestinal damage,
CC	myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia,
CC	for improving engraftment of bone marrow transplants, for enhancing bone
CC	marrow recovery after radiotherapy or chemotherapy and in treatment of
CC	immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic
CC	carcinoma, leukaemia and miliary tuberculosis. The SCF polypeptides are
CC	also used to expand haematopoietic progenitor cells for transplantation
CC	and to prepare such cells for transfection with a gene. The SCF
CC	polynucleotides can be used for recombinant expression of the
CC	polypeptides and also as probes for mapping of the SCF gene, for
CC	identifying SCF-related diseases and as a marker for neighbouring genes.
CC	Antibodies raised against the polypeptides are useful in diagnosis and to
CC	remove SCF from blood. This sequence represents SCF related DNA of the
CC	invention.

XX Pharmacological composition for treating ailments associated with impaired	
PT respiration, has oligo(s) antisense to specific gene(s) or its	
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or	
PT ubiquinone.	
XX PS Disclosure; SEQ ID NO 4122; 872pp; English.	
XX The invention relates to a novel pharmaceutical composition, which has a	
CC first active agent comprising an oligonucleotide antisense to the	
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,	
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of	
CC junctions of genes encoding a polypeptide associated with lung and/or	
CC nasal airway dysfunction and a second active agent comprising an	
CC antiinflammatory steroid and ubiquinone. A composition of the invention	
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,	
CC immunosuppressive, and cytostatic activity. The composition may have a	
CC use in antisense gene therapy. The composition is useful for treating or	
CC for enhancing the prophylactic or therapeutic respiratory effect of an	
CC antiinflammatory steroid in a subject, for reducing or depleting levels	
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine	
CC receptor, producing bronchodilation, increasing levels of ubiquinone or	
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,	
CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
```

```
CC prevent any unwanted effects due to it

CC surfactant depletion or hyposecretion, when administered to a mammal. The

CC oligonucleotides are derived from a gene encoding or regulating  
CC expression of a target polypeptide associated with lung airway or lung  
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
CC The invention also describes a kit, that comprises: (a) a delivery  
CC device, in separate containers, (b) the oligonucleotides, (c)  
CC instructions for adding a carrier and for use of the kit. The composition  
CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
CC beta-adrenergic agonist. The composition is useful for preventing or  
CC treating a respiratory, lung or malignant disease. The administered  
CC composition comprises oligo and is administered to reduce the production  
CC or availability, or to increase the degradation of the target mRNA or to  
CC reduce the amount of target polypeptide present in the lungs. The  
CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
CC inflammation, allergies and/or surfactant hypoproduction are associated  
CC with a disease or condition such as pulmonary vasoconstriction,  
CC inflammation, allergies, asthma, impeded respiration, respiratory  
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
CC hypertension, emphysema, chronic obstructive pulmonary disease, cancer,  
CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
CC The reduced adenosine content of the anti-sense oligos corresponding to  
CC thymidines present in the target RNA serves to prevent the breakdown of  
CC the oligonucleotides into products that free adenosine into the system  
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
CC prevent any unwanted effects due to it

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 4122; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposcretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has anti-allergic, anti-inflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

 PS Claim 4; SEQ ID NO 433; 132pp; English.  
 CC  
 CC The present sequence represents a chimeric antisense oligonucleotide  
 CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The  
 CC human mPGES-1 gene is located on chromosome 9, more specifically to  
 CC 9q34.3. The present invention also describes: (1) antisense compounds,  
 CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding  
 CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and  
 CC inhibits its expression; (2) a method of inhibiting the expression of  
 CC mPGES-1 in cells or tissues; and (3) a method of treating an animal  
 CC having a disease or condition associated with mPGES-1. mPGES-1 chimeric  
 CC antisense oligonucleotides and antisense compounds have cytosolic,  
 CC antidiabetic, immunomodulator, cardiant, neuroprotective,  
 CC antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,  
 CC ophthalmological, immunomodulatory and cardiovascular activities, and can  
 CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound  
 CC can be used for preparing a composition for treating a disease or  
 CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's  
 CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or  
 CC ophthalmic, immunological, cardiovascular or neurological disorder.

 XX  
 CC The invention relates to preparing a (vertebrate) human stem cell factor  
 CC (SCF) polypeptide comprising growing host cells transformed or  
 CC transfected with DNA encoding a human SCF that stimulates growth of  
 CC haematopoietic progenitor cells under nutrient conditions, the DNA being  
 CC operatively linked to an expression control sequence, and isolating the  
 CC polypeptide produced. Also included is a recombinant host cell  
 CC transformed or transfected with an expression construct comprising a  
 CC vertebrate SCF polypeptide-encoding DNA operatively linked to a  
 CC heterologous expression regulatory sequence, permitting the expression of  
 CC the vertebrate SCF polypeptide in the host cell. Disclosed as new are rat  
 CC and human nucleic acids encoding SCF, SCF proteins from a number of other  
 CC mammals and recombinantly expressed SCF protein fragments. The DNA  
 CC sequences are useful for effecting the large scale synthesis of SCF by a  
 CC variety of recombinant techniques or for generating new and useful viral

CC and circular plasmid DNA vectors, new and useful transformed and  
 CC transfected prokaryotic and eukaryotic host cells, and new and useful  
 CC methods for cultured growth of such host cells capable of expression of  
 CC SCF and its related products. The DNA sequences are also useful as  
 CC labelled probes in isolating human genomic DNA encoding SCF, in methods  
 CC of protein synthesis, in genetic therapy in humans and other mammals, and  
 CC in developing transgenic mammalian species which may serve as eukaryotic  
 CC hosts for production of SCF and SCF products in quantity. The SCF is  
 CC useful for treating haematopoietic disorders, e.g., aplastic anaemia,  
 CC paroxysmal nocturnal haemoglobinuria, myelofibrosis, myelosclerosis,  
 CC osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma,  
 CC Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease,  
 CC Letterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo  
 CC syndrome, congestive splenomegaly, Kala awar, sarcoidosis, primary  
 CC splenic pancytopenia, miliary tuberculosis, disseminated fungus disease,  
 CC Fulminating septicaemia, malaria, vitamin B 12 and folic acid deficiency,  
 CC pyridoxine deficiency, Diamond Blackfan anaemia, and hypopigmentation  
 CC disorders such as piebaldism and vitiligo. The SCF are also useful for  
 CC treating neurological damage, infertility states, intestinal damage  
 CC resulting from irradiation or chemotherapy, and AIDS. SCF is also useful  
 CC for enhancing haematopoietic recovery after acute blood loss and as a  
 CC boost to the immune system for fighting neoplasia (cancer). The present  
 CC sequence is a universal SCF PCR primer used in the isolation of SCF DNA.

XX PT Sorting single-stranded nucleic acid, useful for analyzing expression  
XX PT patterns and screening active agents, uses capture agent with variable  
XX PT and constant regions.  
XX PS Example; Page 5; 8pp; German.  
XX CC This invention describes a novel method for sorting single-stranded  
XX CC nucleic acids by isolation and hybridisation of nucleic acid pools, then  
XX CC reading out, where the nucleic acids are selectively bound using capture  
XX CC agents that are (a) immobilised on the surface of a solid matrix and (b)  
XX CC comprise variable and non-variable regions. The capture oligonucleotides  
XX CC have a 5'-invariable anchor region, the complement of which is present at  
XX CC least once in each nucleic acid and a 3'-variable, discriminatory region  
XX CC that comprises all possible combinations of up to 10 nucleotides to allow  
XX CC binding of particular sorts of single stranded nucleic acids. The capture  
XX CC agents are particularly locked nucleic acids (LNA) and the anchor region  
XX CC comprises a sequence of 10-50, particularly 15-25, T residues. The  
XX CC capture oligonucleotides are biotinylated and immobilised on a surface by  
XX CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,  
XX CC metal, resin, gel, crystalline material and/or membrane, having semi-  
XX CC conducting properties and especially in the form of a chip. Its surface  
XX CC is particularly a layer of (bio)molecular filaments and binding of single  
XX CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,  
XX CC physical, stimulated by an electrical field or through a molecular sieve.  
XX CC The method is used (i) for analysis of patterns, especially in mucosal,  
XX CC hair root, blood, nerve or germ cells and (ii) for determining the  
XX CC activity of pharmaceuticals and/or nutritional compounds, e.g. food  
XX CC additives or supplements, especially minerals, trace elements, organic  
XX CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and  
XX CC mixtures. The method provides rapid, inexpensive and reproducible  
XX CC representation of differences in pools of nucleic acids from cells. It  
XX CC allows imaging of the complete pattern of all nucleic acid in a cell, and  
XX CC can detect very small differences in the nucleic acid pool. Since the  
XX CC method is based on comparison of nucleic acid pools, not individual  
XX CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent  
XX CC capture probes used in the method of the invention.

Molecular indexing of DNA - using restriction enzymes, PCR amplification  
and electrophoresis to analyse DNA fragments.  
XX  
Claim 3; Page 14; 20pp; English.  
XX  
AAT33701-T33703 represent amplification primers used in the reverse-  
transcription of tissue or cell derived mRNA, in the method of the  
invention. The method of the invention is a molecular indexing method,  
and comprises digesting the cDNA amplified by these sequences with a  
class IIS restriction enzyme. Each resultant cDNA fragment is then  
ligated to a biotinylated adaptor (selected from a pool of 64 adaptors  
cohesive to all possible overhangs), and digesting the products with two  
further class IIS restriction enzymes. These steps are repeated (but the  
enzyme used for the first step is different in each) to produce two  
further cDNA samples. The ligation samples are then recovered using  
streptavidin-coated paramagnetic beads, removing the strand complementary  
to an adaptor-primer. The adaptor primer and an anchored oligo-dT primer  
(such as this sequence) are then used to amplify the cDNA samples. The  
amplified products are separated, and the sizes of the fragments obtained  
is recorded. The method can be used for the analysis and diagnosis of  
diseases such as cancers or viral infections, for the search and  
isolation of the genes of physiologically active substances that are  
potential pharmaceuticals, or causative genes of hereditary diseases, as  
well as for the isolation of genes for improving agricultural products.  
Using this method, it is possible to classify (index) DNA into groups in  
a short period of time without duplication

Determination of gene expression levels - using combinations of different  
cDNA samples tagged with different PCR adaptors.  
XX  
Example 2; Page 9; 22pp; English.  
XX  
The present sequence represents a primer which was used to synthesise  
Apolipoprotein cDNA in a RT-PCR reaction. This primer as well as primers  
AAV61555 and AAV61556 were added to both mouse liver-derived and mouse  
kidney-derived total RNA to generate single-stranded cDNA. These primers  
were used in the method of the invention to determine the amount ratio  
between a cDNA coding for mouse liver-derived Apolipoprotein and a cDNA  
that codes for the mouse kidney-derived Apolipoprotein by using Adaptor-  
tagged Competitive PCR (ATAC-PCR). This method allows gene expression to  
be quantitatively determined, and because internal standards are not  
required to prepare a calibration curve, it is a quicker and less  
laborious process

 CC The present invention describes a gene detection method which comprises  
 CC fractionating using a probe opposite to the objective gene which is  
 CC hybridised out of fractioned gene cluster. The objective gene detected  
 CC belongs to the group of objective genes contained in the sample. The  
 CC method is used for gene detection by fractionation of cDNA by molecular  
 CC index method using specific primer. It provides high detection  
 CC sensitivity of objective gene. AAA08407 to AAA08414 represent  
 CC oligonucleotides used in the exemplification of the present invention

 PT Vaccinating against tumors, infectious diseases, allergies and asthma  
 PT using immunostimulatory Py-rich and TG nucleic acids.  
 XX  
 PS Disclosure; Page 39; 338pp; English.  
 XX  
 CC The present invention relates to a method for stimulating an immune  
 CC response. The method comprises administering an immunostimulatory nucleic  
 CC acid to a non-rodent subject in sufficient quantity to stimulate an  
 CC immune response. The present sequence is one such immunostimulatory  
 CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich  
 CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects  
 CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae  
 CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,  
 CC haemophilus, campylobacter, clostridium, Escherichia coli and/or  
 CC staphylococcus), fungal antigens and/or parasitic antigens. The method is  
 CC also useful for preventing cancer, asthma, infectious disease, allergy or  
 CC immune deficiency. The present sequence can also be used to redirect a  
 CC Th2 to a Th1 immune response and to activate immune cells. Note: the  
 CC present sequence may have a phosphorothioate backbone

 PT Comparative detection of the amounts of RNA and DNA.  
 XX  
 PS Disclosure; Page 9; 9pp; Japanese.  
 XX

CC The present invention describes a method for the comparative detection of  
 CC the amount of an RNA. The method comprises: (a) cDNAs obtained by  
 CC transcribing respectively from at least two tissue RNAs are respectively  
 CC fragmented by using a same restriction enzyme; (b) each different adaptor  
 CC and a common adaptor are added to each of the cDNA fragments derived from  
 CC the same or different tissues by the step (a); (c) the resultant adaptor-  
 CC added cDNAs are mixed together; (d) an adaptor primer having the common  
 CC sequence to said different adaptor and a gene-specific adaptor are used  
 CC to amplify said adaptor-added cDNAs containing no region derived from  
 CC polyadenylic acid of the mRNA before the addition of the adaptor among  
 CC the adaptor-added cDNAs prepared by the step (b); (e) the ratios of the  
 CC cDNA amounts are measured between the tissues; (f) the RNA is detected  
 CC from the measured result; (g) each different adaptor and a common adaptor  
 CC are added to each of the genomic DNA fragments derived from a same or  
 CC different individuals; (h) the resultant adaptor-added genomic DNAs are  
 CC mixed together; (i) the adaptor-added genomic DNAs are amplified by using  
 CC a sequence-specific adaptor; and (j) the ratios of the amplified adaptor  
 CC of the genomic DNAs are measured between the individuals. The method is  
 CC used for the detection of the amounts of RNA and DNA. The present  
 CC sequence represents an oligonucleotide which is used in the  
 CC exemplification of the present invention

XX New immunostimulatory oligonucleotide comprising non-palindromic nucleic
PT acid sequence motif, useful for inducing B-cell activation, treating,
PT preventing or ameliorating immune system disorder or tumoral disease e.g.
PT melanoma.
XX
XX Example 17; Page 81; 139pp; English.
XX
XX This invention relates to novel immunostimulatory oligonucleotides that
CC contain a non-palindromic sequence motif. Specifically, it refers to DNA
CC oligonucleotides (without a CpG motif), which can stimulate an immune
CC response in animals of the order of primates, including humans. The immune
CC response is characterised by the proliferation, differentiation, cytokine
CC and antibody production in B-cells, as well as cell differentiation and
CC cytokine production in plasmacytoid dendritic cells. The present
CC invention describes immunomodulator compositions that also comprise an
CC antigen selected from, for example, viruses, bacteria, parasites, tumour
CC cells and glycolipids. As such, these DNA oligos can be used in gene
CC therapy for inducing B-cell activation, treating, preventing or
CC ameliorating an immune system disorder or a tumoral disease including
CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell
CC carcinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the
CC invention.

XX
PT New immunostimulatory oligonucleotide comprising non-palindromic nucleic
PT acid sequence motif, useful for inducing B-cell activation, treating,
PT preventing or ameliorating immune system disorder or tumoral disease e.g.
PT melanoma.
XX
PS Example 17; Page 80; 139pp; English.
XX
CC This invention relates to novel immunostimulatory oligonucleotides that
CC contain a non-palindromic sequence motif. Specifically, it refers to DNA
CC oligonucleotides (without a CpG motif), which can stimulate an immune
CC response in animals of the order of primate, including humans. The immune
CC response is characterised by the proliferation, differentiation, cytokine
CC and antibody production in B-cells, as well as cell differentiation and
CC cytokine production in plasmacytoid dendritic cells. The present
CC invention describes immunomodulator compositions that also comprise an
CC antigen selected from, for example, viruses, bacteria, parasites, tumour
CC cells and glycolipids. As such, these DNA oligos can be used in gene
CC therapy for inducing B-cell activation, treating, preventing or
CC ameliorating an immune system disorder or a tumoural disease including
CC chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell
CC carcinoma. This oligonucleotide sequence is a non-CpG DNA oligo of the
XX invention.

PT      New stem cell factor polypeptide(s) - for stimulating the growth of
PT      primitive progenitor cells, esp. for treating disorders involving blood
PT      cells.
XX
PS      Example 3; Fig 12C; 127pp; English.
XX
CC      AAT04915-T04922 are oligonucleotide primers and probes used for the
CC      amplification and sequencing of mammalian stem cell factor (SCF). Non-
CC      naturally occurring SCF and C-terminally truncated polypeptides, having
CC      amino acid sequences sufficiently duplicative of naturally occurring SCF,
CC      stimulate growth of primitive progenitors such as haematopoietic
CC      progenitor cells, neural stem cells and primordial germ stem cells. The
CC      peptides can be used in a composition for treating leucopenia, anaemia or
CC      thrombocytopenia, for enhancing engraftment of bone marrow during
CC      transplantation or for bone marrow recovery after chemotherapy or
CC      radiation-induced bone marrow aplasia or myelosuppression. They can also
CC      be used for treating neoplasia, nerve damage, infertility, intestinal
CC      damage or myeloproliferative disorders. Antibodies may be raised against
CC      the peptides for use in detection or neutralisation of SCF in serum. SCF
CC      may be useful for the treatment of AIDS and severe combined
CC      immunodeficiency (SCID) states alone or in combination with
CC      such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)

PT      Production of hematopoietic cells suitable for administration to a
PT      subject using progenitor cells and expanding the cells using stem cell
PT      factor.
XX
PS      Example 3; Fig 12C; 123pp; English.
XX
CC      A method has been developed of making haematopoietic cells suitable for
CC      administration to a subject. The method comprises: (a) obtaining
CC      haematopoietic progenitor cells from a donor; and (b) expanding the cells
CC      by adding to the cells a haematopoietically effective dose of a
CC      polypeptide product having at least part of the primary structural
CC      confirmation and one or more of the biological properties of naturally
CC      occurring stem cell factor (SCF). The method is useful for stimulating
CC      primitive progenitor cells including early haematopoietic progenitor
CC      cells which are capable of maturing to erythroid, megakaryocyte,
CC      granulocyte, lymphocyte and macrophage cells. SCF results in absolute
CC      increases in haematopoietic cells of both myeloid and lymphoid lineages.
CC      SCF is useful for treating haematopoietic disorders. The method is useful
CC      for expanding early haematopoietic progenitors in syngeneic, allogeneic
CC      or autologous bone marrow transplant. SCF is useful for enhancing the
CC      efficiency of gene therapy based on transfecting haematopoietic stem
CC      cells. SCF is also useful for combating the myelosuppressive effects of
CC      anti-HIV drugs such as AZT and for enhancing haematopoietic recovery
CC      after acute blood loss and as a boost to the immune system for fighting
CC      neoplasia (cancer). The present sequence represents a universal
CC      oligonucleotide which is used in an example from the present invention

XX
XX Enhancing efficiency of transfer of polynucleotide into a target
XX
XX mammalian cell in vitro, involves exposing cell that expresses a stem
XX
XX cell factor receptor to stem cell factor, and introducing polynucleotide
XX
XX into cell in vitro.
XX
XX Example 3; Fig 12C; 210pp; English.
XX
XX The present invention describes a method for enhancing (E) the efficiency
XX
XX of transfer of a polynucleotide (I) into a target mammalian cell (II) in
XX
XX vitro, comprising exposing (II) that expresses a stem cell factor (SCF)
XX
XX receptor to a biologically active SCF, its analogue or fragment, which
XX
XX induces cell proliferation, and introducing (I) to (II) in vitro.
XX
XX Exposure of SCF to (II) results in increased uptake of (I) into the cell.
XX
XX The method is useful for enhancing the efficiency of the transfer of a
XX
XX polynucleotide into a target mammalian cell in vitro. The method is
XX
XX useful in gene therapy techniques. AAH41301 to AAH41364 and AAH98351 to

 XX Novel non-naturally-occurring stem cell factor polypeptide, useful for  
 PT treating leucopenia, thrombocytopenia, anemia and for enhancing  
 PT engraftment of bone marrow during transplantation in a mammal.  
 XX Example 3; Fig 12C; 217pp; English.  
 PS The present invention relates to novel non-naturally-occurring stem cell  
 CC factor (SCF) polypeptides having an amino acid sequence sufficiently  
 CC duplicative of that of naturally-occurring SCF to allow possession of  
 CC haematopoietic biological activity of naturally occurring SCF. Sequences  
 CC of the invention are useful for treating leucopaenia, thrombocytopenia,  
 CC anaemia and for enhancing bone marrow recovery in treatment of radiation,  
 CC engraftment of bone marrow during transplantation in mammals and chemical  
 CC or chemotherapeutic induced bone marrow aplasia or myelosuppression. They  
 CC are also useful for treating acquired immune deficiency in a human, nerve  
 CC damage, neoplasia, infertility, myeloproliferative disorder, intestinal  
 CC damage in a mammal. SCF sequences are useful for preparing biologically  
 CC active polymer polypeptide adduct, for enhancing transfection of early  
 CC haematopoietic progenitor cells with a gene, and transfer of a gene into  
 CC a mammal. They are useful for treating myelofibrosis, myeloclerosis,  
 CC osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma,  
 CC Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease,  
 CC Letterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo  
 CC syndrome, congestive splenomegaly, Kala azar, sarcoidosis, primary  
 CC splenic pancytopenia, disseminated fungus disease, malaria, military  
 CC tuberculosis, fulminating septicemia, pyridoxine deficiency, vitamin B12  
 CC and folic acid deficiency, Diamond Blackfan anaemia, hypopigmentation  
 CC disorders such as piebaldism, AIDS (acquired immune deficiency syndrome)  
 CC and vitiligo. The present sequence is a PCR primer which is used for  
 CC amplifying the 5' end of rat SCF cDNA. This sequence is used in the  
 CC exemplification of the invention

 XX Production of a human stem cell factor (SCF) polypeptide for treating  
 PT disorders involving blood cells, such as leukemia, comprises culturing  
 PT mammalian cells comprising non-human SCF promoter DNA linked to DNA  
 PT encoding the human SCF.  
 XX Example 3; Fig 12C; 120pp; English.  
 PS The present invention relates to novel stem cell factors (SCFs),  
 CC polynucleotide sequences encoding the SCFs, and methods of producing  
 CC them. SCFs are involved in the blood-forming (haematopoietic) system in  
 CC mammals, particularly humans. The method of the invention is useful for  
 CC the production of human SCF. The stem cell factors are useful to treat  
 CC disorders involving blood cells e.g. metastatic carcinoma, acute  
 CC leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, refractory  
 CC erythroblastic anaemia, miliary tuberculosis, disseminated fungus  
 CC disease, malaria, and vitiligo. The present sequence representing a  
 CC universal oligonucleotide for SCF DNA is used in the examples of the  
 CC present invention

 XX

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 3508; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Disclosure; SEQ ID NO 4788; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition of the invention use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

PT Pharmaceutical composition for treating ailments associated with impaired  
 PT respiration, has oligo(s) antisense to specific gene(s) or its  
 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or  
 PT ubiquinone.

PS Disclosure; SEQ ID NO 4482; 872pp; English.

XX The invention relates to a novel pharmaceutical composition, which has a  
 CC first active agent comprising an oligonucleotide antisense to the  
 CC initiation codon, coding region, 5' or 3' and genomic flanking regions,  
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
 CC junctions of genes encoding a polypeptide associated with lung and/or  
 CC nasal airway dysfunction and a second active agent comprising an  
 CC antiinflammatory steroid and ubiquinone. A composition of the invention  
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
 CC immunosuppressive, and cytostatic activity. The composition may have a  
 CC use in antisense gene therapy. The composition is useful for treating or  
 CC preventing a respiratory, lung or malignant disease or condition, also  
 CC for enhancing the prophylactic or therapeutic respiratory effect of an  
 CC antiinflammatory steroid in a subject, for reducing or depleting levels  
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
 CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
 CC lung inflammation, lung allergies, or a respiratory disease or condition.  
 CC Note: The sequence data for this patent is not represented in the printed  
 CC specification, but was obtained in electronic format directly from WIPO

XX Pharmaceutical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.

XX Claim 15; SEQ ID NO 4482; 763pp; English.

XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has antiallergic, antiinflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.

XX Example 1; Page 23; 24pp; Japanese.

The invention relates to a novel intercalator having a specific formula. The intercalator of the invention may be useful for the electrochemical detection of a gene, as an electrochemical double stranded DNA detection reagent and as an intercalator for inhibiting the influence of mismatch DNA and single stranded DNA. The intercalator enables the transmission of electronic transition between two base pairs to occur efficiently. The current sequence is that of the electrochemical detection intercalator-related DNA 2 of the invention.

 PS The present invention relates to an antisense compound targeted to a  
 CC nucleic acid molecule encoding Nav1.3, where the antisense compound  
 CC specifically hybridizes with and inhibits the expression of Nav1.3. The  
 CC compound and composition are useful for treating a disease or condition  
 CC associated with Nav1.3, e.g. pain including but not limited to  
 CC neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,  
 CC diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,  
 CC pain from burns, migraine headache, cluster headache, mild-to-moderate  
 CC headache; seizure disorder such as childhood seizure disorder, including  
 CC but not limited to neonatal or infantile epilepsy; or ataxia. The present  
 CC sequence represents a chimeric phosphorothioate oligonucleotide with  
 CC 2'MOE wings and a deoxy gap. Used during the antisense inhibition of  
 CC human Nav1.3 expression, the oligonucleotides are designed to target  
 CC different regions of the human Nav1.3 RNA.

 XX New antisense oligonucleotides encoding mitONEET, useful for modulating  
 PT mitONEET expression or for treating diseases associated with mitONEET,  
 PT e.g. diabetes, immunological disorders or cardiovascular disorders.  
 XX  
 XX Claim 4; SEQ ID NO 87; 226pp; English.  
 PS  
 CC The invention comprises antisense oligonucleotides that are targeted to  
 CC the nucleic acids encoding a family of human proteins from mitochondrial  
 CC membranes, which bind insulin sensitising, antidiabetic  
 CC thiazolidinediones (referred to as: mitONEET). The antisense  
 CC oligonucleotides of the invention are useful for modulating mitONEET  
 CC expression and for treating diseases or conditions associated with  
 CC mitONEET, such as: diabetes, immunological disorders, cardiovascular  
 CC disorders including hypertension, neurological disorders, and  
 CC ischaemia/reperfusion injuries. The present DNA sequence represents a  
 CC mitONEET-specific antisense oligonucleotide of the invention. NOTE: The  
 CC present sequence is a 2'-methoxyethyl (2'-MOE) gapmer with a  
 CC phosphorothioate backbone.

 XX  
 XX Preparing a human stem cell factor (SCF) polypeptide, useful for treating  
 PT hematopoietic disorders, e.g., aplastic anemia, comprises growing host  
 PT cells transformed or transfected with DNA encoding a human SCF.  
 XX  
 XX Example 3; SEQ ID NO 33; 210pp; English.  
 PS  
 XX The invention relates to preparing a (vertebrate) human stem cell factor  
 CC (SCF) polypeptide comprising growing host cells transformed or  
 CC transfected with DNA encoding a human SCF that stimulates growth of  
 CC haematopoietic progenitor cells under nutrient conditions, the DNA being  
 CC operatively linked to an expression control sequence, and isolating the  
 CC polypeptide produced. Also included is a recombinant host cell  
 CC transformed or transfected with an expression construct comprising a  
 CC vertebrate SCF polypeptide-encoding DNA operatively linked to a  
 CC heterologous expression regulatory sequence, permitting the expression of  
 CC the vertebrate SCF polypeptide in the host cell. Disclosed as new are rat  
 CC and human nucleic acids encoding SCF, SCF proteins from a number of other  
 CC mammals and recombinantly expressed SCF protein fragments. The DNA  
 CC sequences are useful for effecting the large scale synthesis of SCF by a  
 CC variety of recombinant techniques or for generating new and useful viral  
 CC and circular plasmid DNA vectors, new and useful transformed and  
 CC transfected prokaryotic and eukaryotic host cells, and new and useful  
 CC methods for cultured growth of such host cells capable of expression of  
 CC SCF and its related products. The DNA sequences are also useful as  
 CC labelled probes in isolating human genomic DNA encoding SCF, in methods  
 CC of protein synthesis, in genetic therapy in humans and other mammals, and  
 CC in developing transgenic mammalian species which may serve as eukaryotic  
 CC hosts for production of SCF and SCF products in quantity. The SCF is  
 CC useful for treating haematopoietic disorders, e.g., aplastic anaemia,  
 CC paroxysmal nocturnal haemoglobinuria, myelofibrosis, myelocytosis,  
 CC osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma,  
 CC Hodgkin's disease, refractory erythroblastic anaemia, Di Guglielmo  
 CC Letterer-Siwe disease, lymphoma, Gaucher's disease, Niemann-Pick disease,  
 CC syndrome, congestive splenomegaly, Kala awar, sarcoidosis, primary  
 CC splenic pancytopenia, miliary tuberculosis, disseminated fungus disease,  
 CC Fulminating septicemia, malaria, vitamin B 12 and folic acid deficiency,  
 CC pyridoxine deficiency, Diamond Blackfan anaemia, and hypopigmentation  
 CC disorders such as piebaldism and vitiligo. The SCF are also useful for  
 CC treating neurological damage, infertility states, intestinal damage  
 CC resulting from irradiation or chemotherapy, and AIDS. SCF is also useful  
 CC for enhancing haematopoietic recovery after acute blood loss and as a  
 CC boost to the immune system for fighting neoplasia (cancer). The present  
 CC sequence is a universal SCF PCR primer used in the isolation of SCF DNA.

XX  
XX A method for the analysis of cDNA comprises (a) preparing an aggregate of  
XX CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of  
XX CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)  
XX CC and using the aggregate of mRNAs as the template for each reverse  
XX CC transcription primer; (b) digesting each of the prepared aggregates of  
XX CC the double-stranded cDNAs with restriction enzyme and; (c)  
XX CC electrophoresing the digested aggregate of cDNAs in separate lanes. The  
XX CC method can be used to analyse gene expression rapidly and easily

XX Analysis of cDNA and gene expression - by amplification of mRNA followed  
PT by digestion with restriction enzymes.

XX Disclosure; Page 8; 11pp; Japanese.

XX A method for the analysis of cDNA comprises (a) preparing an aggregate of  
CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of  
CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)  
CC and using the aggregate of mRNAs as the template for each reverse  
CC transcription primer; (b) digesting each of the prepared aggregates of  
CC the double-stranded cDNAs with restriction enzyme and; (c)  
CC electrophoresing the digested aggregate of cDNAs in separate lanes. The  
CC method can be used to analyse gene expression rapidly and easily

PS Example; Page 4; 8pp; German.  
XX  
CC This invention describes a novel method for sorting single-stranded  
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then  
CC reading out, where the nucleic acids are selectively bound using capture  
CC agents that are (a) immobilised on the surface of a solid matrix and (b)  
CC comprise variable and non-variable regions. The capture oligonucleotides  
CC have a 5'-invariable anchor region, the complement of which is present at  
CC least once in each nucleic acid and a 3'-variable, discriminatory region  
CC that comprises all possible combinations of up to 10 nucleotides to allow  
CC binding of particular sorts of single stranded nucleic acids. The capture  
CC agents are particularly locked nucleic acids (LNA) and the anchor region  
CC comprises a sequence of 10-50, particularly 15-25, T residues. The  
CC capture oligonucleotides are biotinylated and immobilised on a surface by  
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,  
CC metal, resin, gel, crystalline material and/or membrane, having semi-  
CC conducting properties and especially in the form of a chip. Its surface  
CC is particularly a layer of (bio)molecular filaments and binding of single  
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,  
CC physical, stimulated by an electrical field or through a molecular sieve.  
CC The method is used (i) for analysis of patterns, especially in mucosal,  
CC hair root, blood, nerve or germ cells and (ii) for determining the  
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food  
CC additives or supplements, especially minerals, trace elements, organic  
CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and  
CC mixtures. The method provides rapid, inexpensive and reproducible  
CC representation of differences in pools of nucleic acids from cells. It  
CC allows imaging of the complete pattern of all nucleic acid in a cell, and  
CC method is based on comparison of nucleic acid pools, not individual  
CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent  
XX capture probes used in the method of the invention.

 XX  
 CC This invention describes a novel method for sorting single-stranded  
 CC nucleic acids by isolation and hybridisation of nucleic acid pools, then  
 CC reading out, where the nucleic acids are selectively bound using capture  
 CC agents that are (a) immobilised on the surface of a solid matrix and (b)  
 CC comprise variable and non-variable regions. The capture oligonucleotides  
 CC have a 5'-invariable anchor region, the complement of which is present at  
 CC least once in each nucleic acid and a 3'-variable, discriminatory region  
 CC that comprises all possible combinations of up to 10 nucleotides to allow  
 CC binding of particular sorts of single stranded nucleic acids. The capture  
 CC agents are particularly locked nucleic acids (LNA) and the anchor region  
 CC comprises a sequence of 10-50, particularly 15-25, T residues. The  
 CC capture oligonucleotides are biotinylated and immobilised on a surface by  
 CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,  
 CC metal, resin, gel, crystalline material and/or membrane, having semi-  
 CC conducting properties and especially in the form of a chip. Its surface

CC is particularly a layer of (bio)molecular filaments and binding of single  
 CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,  
 CC physical, stimulated by an electrical field or through a molecular sieve.  
 CC The method is used (i) for analysis of patterns, especially in mucosal,  
 CC hair root, blood, nerve or germ cells and (ii) for determining the  
 CC activity of pharmaceuticals and/or nutritional compounds, e.g. food  
 CC additives or supplements, especially minerals, trace elements, organic  
 CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and  
 CC mixtures. The method provides rapid, inexpensive and reproducible  
 CC representation of differences in pools of nucleic acids from cells. It  
 CC allows imaging of the complete pattern of all nucleic acid in a cell, and  
 CC can detect very small differences in the nucleic acid pool. Since the  
 CC method is based on comparison of nucleic acid pools, not individual  
 CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent  
 CC capture probes used in the method of the invention.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture

CC agents that are (a) immobilised on the surface of a solid matrix and (b)  
 CC comprise variable and non-variable regions. The capture oligonucleotides  
 CC have a 5'-invariable anchor region, the complement of which is present at  
 CC least once in each nucleic acid and a 3'-variable, discriminatory region  
 CC that comprises all possible combinations of up to 10 nucleotides to allow  
 CC binding of particular sorts of single stranded nucleic acids. The capture  
 CC agents are particularly locked nucleic acids (LNA) and the anchor region  
 CC comprises a sequence of 10-50, particularly 15-25, T residues. The  
 CC capture oligonucleotides are biotinylated and immobilised on a surface by  
 CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,  
 CC metal, resin, gel, crystalline material and/or membrane, having semi-  
 CC conducting properties and especially in the form of a chip. Its surface  
 CC is particularly a layer of (bio)molecular filaments and binding of single  
 CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,  
 CC physical, stimulated by an electrical field or through a molecular sieve.  
 CC The method is used (i) for analysis of patterns, especially in mucosal,  
 CC hair root, blood, nerve or germ cells and (ii) for determining the  
 CC activity of pharmaceuticals and/or nutritional compounds, e.g. food  
 CC additives or supplements, especially minerals, trace elements, organic  
 CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and  
 CC mixtures. The method provides rapid, inexpensive and reproducible  
 CC representation of differences in pools of nucleic acids from cells. It  
 CC allows imaging of the complete pattern of all nucleic acid in a cell, and  
 CC can detect very small differences in the nucleic acid pool. Since the  
 CC method is based on comparison of nucleic acid pools, not individual  
 CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent  
 CC capture probes used in the method of the invention.

XX CC The invention relates to nucleotide sequences encoding spearmint (-)-
XX CC limonene-6-hydroxylase (L6H) and peppermint (-)-limonene-3- hydroxylase
XX CC (L3H). Host cells containing a vector comprising the nucleotide sequences
XX CC can be used for the recombinant production of limonene hydroxylases or of
XX CC primary enzyme products. The primary enzyme products are trans-carveol in
XX CC the case of (-)-L6H or trans-isopiperitenol in the case of (-)-L3H, which
XX CC are of subsequent use, to obtain enhanced expression of limonene
XX CC hydroxylase in plants to obtain enhanced trans- carveol or trans-
XX CC isopiperitenol production as a predator or pathogen defense mechanism,
XX CC attractant or environmental signal. The limonene hydroxylase cDNAs also
XX CC provide a useful tool for isolating other monoterpene hydroxylase genes
XX CC and for examining the developmental regulation of monoterpene
XX CC biosynthesis. Sequences AAX0564-73 represent primers for the PCR
XX CC amplification of (-)-limonene-6-hydroxylase cDNA

XX PT seedling growth comprises transgene comprising a sequence expressing
XX PT altered levels of an essential hormone.
XX XX
XX PS Example 17; Page 262; 267pp; English.
XX CC The present primer was used to reverse transcribe cDNA encoding a C-20
XX CC oxidase. The amplify fragment is used in the method of the invention.
XX CC The specification describes methods for the inhibition and control of
XX CC gibberellic acid levels. Gibberellic acid levels may be inhibited or
XX CC controlled by use of a chimeric expression construct expressing a RNA or
XX CC protein which suppresses the gibberellin biosynthetic pathway sequence,
XX CC diverts substrate from the pathway, or degrades pathway substrates or
XX CC products. The methods uses copalyl diphosphate synthase, 3beta-
XX CC hydroxylase, 2-oxidase, phytoene synthase, C-20 oxidase, and a
XX CC 2beta,3beta-hydroxylase polynucleotides to achieve this. The method is
XX CC used to control seed germination and seedling growth especially to
XX CC regulate gene products of gibberellin biosynthetic pathway and
XX CC restoration of normal seed germination, in transgenic plants. The plants
XX CC produced are gibberellin deficient, and have shortened hypocotyl and/or
XX CC epicotyl phenotypes compared to normal plants

DR	
XX	Example 1; Page 79; 188pp; English.
XX	The present invention relates to an isolated nucleic acid regulated by
CC	fatty lesion development, which comprises any of 55 polynucleotide
CC	sequences from Oryctolagus cuniculus. The polynucleotide, polypeptide or
CC	antibody is useful for preventing, treating, modulating or ameliorating a
CC	medical condition, particularly atherosclerosis. The invention is used as
CC	a marker or detector of nervous system disorder or disease (e.g.
CC	Parkinson's disease, Alzheimer's disease, ischaemia, dementia). The
CC	invention may also be useful for treating deficiencies or disorders of
CC	the immune system (e.g. lymphopaenia, leukocyte adhesion deficiency
CC	syndrome or haemoglobinuria, anaemia), hyperproliferative disorders
CC	(e.g.Gaucher's disease), infectious disease (e.g. herpes simplex).
CC	coagulation disorders, blood platelet disorders and autoimmune disorders
CC	(Addison's disease, rheumatoid arthritis, dermatitis, Grave's disease).
CC	The polynucleotide sequence is also used in gene therapy. The present
CC	sequence is a 3' sequencing primer used in the identification and
CC	characterisation of polynucleotides up-regulated by fatty lesion
CC	development

PT	New neuroleptic-regulated polynucleotides expressed in the central
PT	nervous system for diagnosing and treating neuropsychiatric disorders
PT	such as schizophrenia, bipolar disorder and addiction-related behavior.
XX	
PS	Example 1; Page 87; 210pp; English.
XX	
CC	The present invention describes isolated neuroleptic-regulated nucleic
CC	acid molecules. (I) have neuroleptic, antimanic and antidepressant
CC	activities, and can be used in gene therapy. (I), polypeptides (II)
CC	encoded by (I), or a host cell (III) comprising (I), are useful for
CC	preventing, treating, modulating or ameliorating a medical condition such
CC	as a neuropsychiatric disorder. (I) are useful as diagnostic agents for
CC	diagnosing a pathological condition or susceptibility to a pathological
CC	condition such as neuropsychiatric disorder e.g. schizophrenia, a bipolar
CC	disorder or addition-related behaviour. (I) are useful for detecting the
CC	presence of a nucleic acid encoding a protein in a mammalian tissue
CC	sample. (I) can be used as probes and primers for chromosome
CC	identification, to control gene expression through triple helix formation
CC	or antisense DNA or RNA, in gene therapy to treat the above mentioned
CC	disorders, identifying individuals from minute biological samples, as an
CC	alternative to restriction fragment length polymorphism (RFLP) and as
CC	polymorphic markers for forensic purposes. (I) is also useful as
CC	molecular weight markers on Southern gels, diagnostic probes for the
CC	presence of specific mRNA in a particular cell type, as a probe to
CC	subtract-out known sequences in the process of discovering novel
CC	polynucleotides, for selecting and making oligomers for attachment to a
CC	gene chip or other support, to raise anti-DNA antibodies using DNA
CC	immunisation technique, and as an antigen to elicit an immune response.
CC	AAH21877 to AAH21984, AAB98083 and AAB98084 represent sequences used in
CC	the exemplification of the present invention

 CC The present sequence represents a primer used to isolate novel mouse  
 CC microglia and macrophage regulatory gene DST (digital sequence tag)  
 CC sequences. AAS06401-AAS06590 represent these novel sequences and the  
 CC primer sequences used to isolate them. The PCR-based total gene  
 CC expression analysis (TOGA) system is used to examine the expression  
 CC pattern of molecules corresponding to genes that are regulated in  
 CC unstimulated microglia, activated microglia, unstimulated macrophage and  
 CC activated macrophage. The polynucleotides of the invention, the  
 CC polypeptides encoded by them and antibodies that bind to these  
 CC polypeptides are useful for the diagnosis, prevention,  
 CC treatment or amelioration of a medical condition, preferably a  
 CC neuroinflammatory pathology or a neurodegenerative disease such as

CC Alzheimer's disease, senile dementia, Parkinson's disease, obsessive  
 CC compulsive disorders, epilepsy, schizophrenia, multiple sclerosis,  
 CC depression and bipolar manic-depressive disorder. The sequences and  
 CC methods of the invention can also be used for detecting or treating  
 CC infectious disorders (e.g. AIDS), hyperproliferative disorders (e.g.  
 CC cancer), immune disorders (e.g. severe combined immunodeficiency, SCID)  
 CC autoimmune diseases (e.g. insulin dependent diabetes mellitus),  
 CC inflammatory disorders (e.g. arthritis). The polynucleotides can be used  
 XX for gene therapy

 CC This invention relates to the cDNA sequences of novel isolated  
 CC polynucleotides associated with psychoses or other neuropsychiatric  
 CC disorders. The sequences of the invention may act as blockers of D.2  
 CC receptors in the meso-limbic dopamine system. The nucleotide sequences of  
 CC the invention and the polypeptides encoded by them are useful in the  
 CC manufacture of a medicament useful for preventing, treating, modulating  
 CC or ameliorating a medical condition e.g. a neuropsychiatric disorder. An  
 CC antibody that binds the proteins of the invention is useful for  
 CC preventing, treating, modulating or ameliorating neurological disorders  
 CC such as psychoses or other neuropsychiatric disorders in a subject. The  
 CC sequences are also useful for diagnosing neurological disorders or a

CC susceptibility to a neurological disorder such as psychoses and other  
 CC neuro psychiatric disorders in a subject by determining the presence or  
 CC absence of mutation in the nucleotide sequence of apolipoprotein D or by  
 CC determining the alteration (increase or decrease) in the expression of  
 CC apolipoprotein D. The sequences of the invention are useful in treating  
 CC deficiencies or disorders of the central nervous system or peripheral  
 CC nervous system by activating or inhibiting the proliferation,  
 CC differentiation or mobilisation (chemotaxis) of neuroblasts, stem cells  
 CC or glial cells. The sequences are useful as a marker or detector of a  
 CC particular nervous system disease or disorder such as Alzheimer's  
 CC disease, Pick's disease, Binswanger's disease, other senile dementia,  
 CC Parkinson's disease, obsessive compulsive disorders, epilepsy,  
 CC encephalopathy, ischaemia, addiction, multiple sclerosis, depression and  
 CC manic-depressive disorder. The present sequence represents an  
 CC oligonucleotide primer used in the identification of the cDNA sequences  
 CC of the invention

CC The present invention describes an isolated polynucleotide (I) and its  
 CC complements, and degenerate variants, comprising a sequence selected from  
 CC those given in ABQ73206 to ABQ73222 (NS), which is a digital sequence tag  
 CC (DST) corresponding to mRNA whose expression is regulated by  
 CC proliferative lesion development caused by mechanically induced intimal  
 CC hyperplasia, or by lercanidipine treatment, or by proliferative lesions  
 CC and reversed by lercanidipine treatment. (I) has antiatherosclerotic  
 CC activity and can be used in gene therapy. (I) can be used for diagnosing  
 CC a medical condition (e.g. atherosclerosis) in a subject which involves

CC determining the presence or absence of a mutation in (I) and diagnosing  
 CC the medical condition based on the presence or absence of the mutation.  
 CC (I) is also useful for diagnosing atherosclerosis, or the susceptibility  
 CC to atherosclerosis in a subject which involves detecting an alteration  
 CC (an increase or decrease) in amount of expression of (I). (I) is also  
 CC useful for diagnosing or monitoring the effects of treating a subject  
 CC with dihydropyridine calcium antagonist e.g., lercanidipine. (I) can also  
 CC be used for preventing, treating, modulating, or ameliorating a medical  
 CC condition such as atherosclerosis in a mammalian subject. The present  
 CC sequence represents a TOGA primer which is used in the exemplification of  
 CC the present invention

 PS Preventing and treating hepatitis viral infection in a mammal, comprises  
 PT administering nucleic acid molecules that up- or down-regulate in  
 PT hepatitis B virus infection or polypeptides encoded by the nucleic acid  
 PT molecules.  
 XX  
 PS Disclosure; Page 28; 125pp; English.

CC The present invention relates to a method for preventing, treating,  
 CC modulating or ameliorating a medical condition. The method involves  
 CC administering one or more nucleic acid molecules up- or down-regulated in  
 CC hepatitis B virus (HBV) infection or polypeptides encoded by the nucleic  
 CC acid molecules or antibodies that bind to the polypeptide. The method is  
 CC useful for preventing, treating, modulating or ameliorating a medical  
 CC condition. It is also useful for determining the presence or absence of a  
 CC mutation in the nucleic acid molecules or detecting an alteration in  
 CC expression of the polypeptide which is useful for the diagnosis of  
 CC hepatitis viral infection. The method is useful for assessing the stage  
 CC of hepatitis viral infection (e.g., acute hepatitis versus chronic  
 CC hepatitis) or assessing the efficacy or toxicity of therapeutic treatment  
 CC for hepatitis viral infection and a gene expression profile is useful for

CC identifying polypeptides and polynucleotides which are associated with  
CC hepatitis viral infection. Sequences of the invention are used in gene  
CC therapy and as vaccines. Nucleic acid sequences are useful as a  
CC diagnostic markers for HBV infection and for treating infectious  
CC diseases. The present DNA sequence is a PCR primer which is used for  
CC direct sequencing of TOGA (Total Gene expression Analysis) generated PCR  
CC products

XX Control of gibberellin levels in plants useful to avoid unfavorable  
PT conditions in crops to increase yields, using transgenic plants having  
PT reduced seed germination and early seedling growth then treatment to  
PT restore these properties.  
XX  
PS Example 19; Page 104; 155pp; English.

CC The invention relates to control of gibberellin (GA) levels in plants.  
CC The method involves producing transgenic plants having a phenotype of  
CC reduced seed germination and reduced early seedling growth, then  
CC restoring seed germination and reduced early seedling growth, then  
CC with an appropriate compound when conditions are favourable. The method  
CC is useful to control seed germination and/or early seedling growth in  
CC agricultural production so that unfavorable environmental conditions  
CC normally reducing agronomic output can be avoided and yields increased.  
CC Plants also demonstrate increased uniformity of germination, emergence  
CC and seedling vigor, so increasing yields at harvest. The method is  
CC especially useful in crop plants such as e.g. canola, soybean, cotton,  
CC etc., and is also useful in storage and transport of seeds to reduce  
CC premature germination which may affect agronomic or food quality of the  
CC seeds. The present sequence is a PCR primer used to isolate pumpkin 2beta  
CC 3beta hydroxylase cDNA. This primer is used in the exemplification of  
CC the invention

PT polypeptide segment and a segment comprising a histone deacetylase  
PT chromatin-associated protein complex subunit, useful for modulating gene  
PT expression in cells.  
XX  
PS Example 10; Page 54; 85pp; English.

XX The specification describes chimeric histone acetyltransferase  
CC polypeptides. The chimeric polypeptides comprise a polypeptide segment  
CC that exhibits histone acetyltransferase activity, and a polypeptide  
CC segment having 40% or greater sequence identity to a subunit of a histone  
CC deacetylase chromatin-associated protein complex. The chimeric  
CC polypeptides are useful for determining gene expression profiles in  
CC specific cells, for modulating gene expression in specific cells, and for  
CC making genetically modified eukaryotes. The present sequence represents a  
CC reverse transcription primer used in the method of the invention

 PT New tumor-associated oligopeptide, useful particularly for treating  
 PT multiple myeloma, is recognized by CD8 cytotoxic T cells, also  
 PT derivatives and related nucleic acid.  
 XX  
 PS Disclosure; Page 22; 64pp; German.  
 XX  
 CC This invention describes a novel tumor-associated oligopeptide that is  
 CC recognized as an antigen by CD8+ cytotoxic T lymphocytes (CTL) and causes  
 CC CTL-induced lysis and/or apoptosis of tumor cells, especially multiple  
 CC myeloma cells. The oligopeptide is derived from human PRDI-BF1 (positive  
 CC regulatory domain I-binding factor-1) which is able to induce an MHC  
 CC (major histocompatibility complex) Class I allele variant A2-restricted  
 CC immune response of CD8+ CTL against tumor cells. The products of the  
 CC invention have cytostatic activity and can be used in a vaccine. The  
 CC peptide of the invention, also related retro-inverse and pseudopeptides,  
 CC and T cell receptors specific for PRDI-BF1 peptides are useful for  
 CC treating diseases associated with PRDI-BF1, particularly tumors. The  
 CC products of the invention are also useful as diagnostic, therapeutic and  
 CC prophylactic agents for detecting, modifying, generating, expanding  
 CC and/or regulating activation and functional status of T cells, and for  
 CC preparation of poly- or mono-clonal or recombinant A2-restricted T cell  
 CC receptors and their functional equivalents. This sequence represents an  
 CC RT-PCR primer used to amplify the human PRDI-BF1 gene described in the  
 CC invention.

 PT Preparing a library of same-length signature sequences from a source  
 PT nucleic acid population by ligating to the cleaved ends, a second adapter  
 PT containing a recognition and cleavage site for a second restriction  
 PT endonuclease.

XX Disclosure; Fig 2a; 54pp; English.

XX This invention relates to a novel method for preparing a library of same-length signature sequences from a source nucleic acid population.

XX Specifically, it comprises producing solid phase cloned libraries of oligonucleotide tag-DNA signature sequence constructs, which are useful for sequencing many polynucleotides simultaneously. The present invention describes a kit for the construction of adapter-signature-adapters constructs using 'first' and 'second' adapters each containing a specific restriction endonuclease recognition site, and which flanks the same length signature sequence. As such, using the method described herein it is possible to do parallel sequencing of large populations of polynucleotides for genomic mapping, genetic identification and medical diagnostics. This oligonucleotide sequence is a DNA oligo involved in the step wise process of preparing a library of same length signature sequences from restriction fragments in an exemplification of the invention.

XX oligonucleotide, amplification of resultant DNA fragment and analysis and  
XX labelling of amplified DNA.  
XX  
XX Example 5; Page 12; 17pp; Japanese.

XX This invention describes a novel method for the analysis of a DNA fragment  
XX which comprises: (i) addition of a known common oligonucleotide sequence  
XX to at least one terminal of each DNA fragment, (ii) amplification of the  
XX resultant DNA fragment as a primer using a first common primer containing  
XX a complementary nucleotide sequence to the above mentioned known common  
XX oligonucleotide sequence, a second common primer containing a  
XX complementary nucleotide sequence to the prepared known common  
XX oligonucleotide sequence optionally having been introduced with  
XX complementary nucleotide sequence at a terminal, and a specific primer  
XX capable of hybridisation with a DNA fragment containing whole or part of  
XX the gene having known sequence, to give amplified DNA, (iii) analysis of  
XX the amplified DNA to find the information of the DNA fragment, in which  
XX the specific primer is designed to prepare fragments of the common first  
XX and second primers and to give short fragment of amplified DNA and (iv)  
XX labelling them to make their differentiation. Differentiation of  
XX informations of known and unknown genes readily provides information of  
XX unknown gene and simultaneous monitoring of signals derived from minor  
XX genes. Furthermore, labelling of DNAs according to functions of known  
XX genes can be performed. AAZ09189-209201 represent oligonucleotide primers  
XX used to illustrate the method of the invention

XX Solid phase immunoassay using oligo:nucleotide as label - also new

PT conjugates of oligo:nucleotide coupled to antigenic peptide, partic. for

PT diagnosing hepatitis C or E virus infection.

XX Example; Page 12; 34pp; English.

XX AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides.

CC They are used in a method for detecting an antigen in a subject. The

CC method involves binding the antigen to a solid support and then reacting

CC it with an immunoreactive ligand (L) bound to an oligo; removing any

CC unreacted L, and then detecting the presence of the oligo. A similar

CC method can be used to detect Abs, in which case the ligand is an oligo-

CC labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab

CC to be detected at very low levels. An exemplary oligo is AAQ75024 which

CC can be covalently attached by the 5'- terminus to the N- or C-terminal of

CC a synthetic peptide. In the example, peptide AAR62941 was coupled to

CC oligo AAQ75024 using disuccinimidyl suberate. Serum samples suspected to

CC contain HEV Abs were immobilised on plastic tubes or wells, then

CC incubated for 30-60 mins with the peptide-oligo product. The vessels were

CC washed; bound oligo was released with 0.2M glycine and amplified in a

CC separate tube using as primers AAQ75025 and AAQ75026 in 30 cycles of PCR.

CC The amplification product - AAQ75031 - was treated with uracil DNA

CC glycosylase to remove the U18 fragment, and the product captured by

CC immobilised oligo-dT. (Updated on 25-MAR-2003 to correct PN field.)

XX Treating bacterial infections in humans or animals with  
 PT oligo:nucleotide(s) - resistant to nuclease and targetted to bacterial  
 PT nucleic acid or proteins, also conjugates of these oligo:nucleotide(s)  
 PT with antibiotics.

XX Claim 49; Page 87; 163pp; English.

XX This antisense oligonucleotide is nuclease resistant and can be used in  
 CC the treatment of animals, including humans, having a bacterial infection.  
 CC The treatment comprises administration of such nuclease resistant  
 CC oligonucleotides, targeted to a nucleic acid or protein of the bacterium,  
 CC and formulated with a carrier. A compound comprising this nuclease  
 CC resistant oligonucleotide can be covalently linked to an antibiotic. The  
 CC method is used to treat infections by a wide variety of Gram-positive and  
 CC Gram-negative, or acid-fast, bacteria, in human and veterinary medicine.  
 CC The methods are particularly used in immuno-compromised individuals (e.g.  
 CC patients with acquired immunodeficiency syndrome or those receiving  
 CC chemotherapy or radiation therapy), optionally in combination with, or  
 CC fused to, antiviral or other antimicrobial oligonucleotides. Apart from  
 CC therapeutic use, the oligonucleotides can be used to control bacteria in  
 CC laboratory cultures, foods, beverages and industrial processes. The  
 CC oligonucleotides are specific for bacteria, without affecting metabolism  
 CC in mammalian cells. They may also activate RNase H and have a general,  
 CC non-specific immune-stimulating effect. The oligonucleotides can be  
 CC administered orally, intranasally, rectally, topically or by injection,  
 CC optionally coupled to an agent (e.g. carbohydrate or polyamine) that  
 CC enhances cellular uptake

 CC specific inhibition of gene transcription and expression in a host. The  
 CC composition comprises oligonucleotides containing arabinose sugars that  
 CC can hybridise to either a single-stranded (ss) RNA to induce RNase H  
 CC cleavage activity, or to a DNA/DNA or DNA/RNA duplex to form a triple  
 CC helix, thereby inhibiting DNA replication and/or transcription. The  
 CC oligoarabinonucleotides are used for antisense inhibition of gene  
 CC expression or to prevent DNA replication, or reverse transcription of RNA  
 CC by retroviruses. The compositions are therefore particularly used to  
 CC inhibit retroviral replication. The oligoarabinonucleotides can also be  
 CC used, in combination with RNase H, as reagents for sequence-specific  
 CC cleavage or RNA mapping, and additionally for the study and control of  
 CC gene expression in cells. The oligoarabinonucleotides have excellent  
 CC affinity for RNA, increased resistance to nucleases and show little if  
 CC any non-specific binding to cellular or serum proteins. They target ss  
 CC RNA, but not complementary ss DNA, so may be useful for targeting  
 CC retroviral genomic RNA to inhibit the early stages of viral replication.  
 CC Oligoarabinonucleotides containing pyrimidine bases form triple helices  
 CC with significantly higher thermal stability than those produced by normal  
 CC oligonucleotides. Sequences AAZ87160-287164 represent  
 CC oligoarabinonucleotides containing beta-D-arabinose used in an  
 CC exemplification of the present invention

XX Novel secreted factor encoded by clone P00188D12 which is differentially
XX expressed in certain disease states, useful in diagnosing and treating
XX cardiac, renal or inflammatory diseases.
XX
XX Example 1; Page 42; 71pp; English.
XX
XX The patent discloses novel secreted factor protein encoded by clone
XX P00188 D12. The secreted factor is differentially expressed in certain
XX disease states. Secreted protein, its antibodies, antagonists or
XX compositions comprising them are useful in the diagnosis and treatment of
XX cardiac diseases such as congestive heart failure, myocarditis,
XX hypertrophic cardiomyopathy, angina pectoris, myocardial infarction,
XX cardiac arrhythmia, arteriosclerosis, kidney diseases such as acute renal
XX failure, renal glucosuria, renal infarction, nephrogenic diabetes
XX insipidus, polycystic kidney disease, hereditary nephritis and
XX inflammatory diseases such as asthma, autoimmune diabetes, tumour
XX angiogenesis, rheumatoid arthritis, osteoarthritis, toxic shock syndrome,
XX asthma, stroke, neural trauma, psoriasis, cerebral malaria, osteoporosis,
XX Crohn's disease, ulcerative colitis, Alzheimer's disease. Secreted
XX protein DNA is useful in antisense-mediated gene inhibition and in gene
XX therapy. An array comprising one or more oligonucleotides complementary
XX to reference RNA or DNA encoding the secreted factor is useful for
XX detecting cardiac, kidney and inflammatory disease. The present DNA
XX sequence is an oligonucleotide which is used in the preparation of a
XX normalised cDNA library containing secreted factor DNAs. The normalised
```

PT Fibronectin scaffold protein array for obtaining a protein/compound which
PT binds to a compound/protein, comprises a fibronectin type III domain
PT having a randomized loop, a randomized beta-sheet or their combination.
XX
PS Disclosure; Page 25; 67pp; English.
XX
CC The present invention relates to an array of proteins (antibody mimics)
CC comprising a fibronectin type III domain having a randomised loop, a
CC randomised beta-sheet, or their combination, and has the capacity to bind
CC to a compound that is not bound by a corresponding naturally- occurring
CC fibronectin, immobilised onto a solid support. The antibody mimics is
CC useful for detecting a compound preferably a protein, in a biological
CC sample. It is also useful to detect one or more different analytes
CC simultaneously in a sample. Hence is useful for diagnostic purposes. It
CC is also useful for the purpose of designing proteins capable of binding
CC to virtually any compound of interest. The present sequence is an
CC oligonucleotide A18-2PEG linker used in an exemplification of the
CC invention

CC The present sequence corresponds to polylinker DNA of the phagemid vector

CC PCR2.1. It was used in the construction of a normalised rat cDNA library,

CC which was used in an example demonstrating differential expression of a

CC rat gene referred to as clone P00210D09. The invention relates to a

CC polypeptide comprising a sequence of at least 80% identity to residues 22

CC 122 of the present sequence, or a sequence encoded by a nucleic acid

CC hybridising under stringent conditions to the complement of the coding

CC region comprising 1031 nucleotides, and having at least one biological

CC activity of the polypeptide encoded by clone P00210D09. The polypeptides

CC and polynucleotides of the invention are useful for the treatment of

CC cardiac, renal and inflammatory diseases. The polynucleotides are useful

CC in antisense mediated gene inhibition and in gene therapy. The

CC polypeptides are useful in assays for identifying lead compounds that may

CC be used as therapeutic agents in the treatment of cardiac, kidney or

CC inflammatory diseases

 XX Increasing efficiency of second strand cDNA synthesis using terminal  
 PT continuation model before performing further RNA amplification by RNA  
 PT transcription.  
 XX Example 7; Page 80; 128pp; English.  
 XX This invention relates to a novel method for increasing the efficiency of  
 CC second strand cDNA synthesis through a mechanism of terminal  
 CC continuation. In the method an RNA molecule is obtained and a first  
 CC primer is added that comprises a region that hybridizes to a  
 CC complementary region of the molecule before a second primer is added  
 CC comprising at least one riboguanine at the 3' end of the primer. A first  
 CC complementary nucleic acid molecule is synthesized, the RNA molecule and  
 CC second primer are removed and a second complementary nucleic acid  
 CC molecule is synthesised to form a second hybrid with an extension product  
 CC of the third primer bound to the first complementary molecule. The method  
 CC of the invention is useful for increasing the efficiency of second strand  
 CC cDNA synthesis and may be used for linear amplification of genetic  
 CC signals from histologically stained tissue. The present sequence  
 CC represents a poly d(T) PCR primer used in the method of the invention

 PS  
 XX The present invention describes a method for the comparative detection of  
 CC the amount of an RNA. The method comprises: (a) cDNAs obtained by  
 CC transcribing respectively from at least two tissue RNAs are respectively  
 CC fragmented by using a same restriction enzyme; (b) each different adaptor  
 CC and a common adaptor are added to each of the cDNA fragments derived from  
 CC the same or different tissues by the step (a); (c) the resultant adaptor-  
 CC added cDNAs are mixed together; (d) an adaptor primer having the common  
 CC sequence to said different adaptor and a gene-specific adaptor are used  
 CC to amplify said adaptor-added cDNAs containing no region derived from  
 CC polyadenylic acid of the mRNA before the addition of the adaptor among  
 CC the adaptor-added cDNAs prepared by the step (b); (e) the ratios of the  
 CC cDNA amounts are measured between the tissues; (f) the RNA is detected  
 CC from the measured result; (g) each different adaptor and a common adaptor  
 CC are added to each of the genomic DNA fragments derived from a same or  
 CC different individuals; (h) the resultant adaptor-added genomic DNAs are  
 CC mixed together; (i) the adaptor-added genomic DNAs are amplified by using  
 CC a sequence-specific adaptor; and (j) the ratios of the amplified amounts  
 CC of the genomic DNAs are measured between the individuals. The method is  
 CC used for the detection of the amounts of RNA and DNA. The present  
 CC sequence represents an oligonucleotide which is used in the  
 CC exemplification of the present invention

 PT target RNA in a system, comprises a modified deoxyribonucleotide.  
 XX  
 PS Example 2; Fig 9; 104pp; English.

CC The invention relates to an acyclic linker-containing oligonucleotide  
 CC comprising at least one modified deoxyribonucleotide. Oligonucleotides of  
 CC the invention are useful for preventing or decreasing translation,  
 CC reverse transcription and/or replication of a target RNA in a system.  
 CC They are useful for selectively preventing gene expression in a sequence-  
 CC specific manner, for hybridising to complementary RNA such as cellular  
 CC mRNA or viral RNA, to hybridise to and induce cleavage of complementary  
 CC RNA. They are also useful therapeutically in formulations or medicaments  
 CC to prevent or treat a disease characterised by the expression of a  
 CC particular target RNA. The invention is used in gene therapy. The present  
 CC sequence is an antisense oligo used to elicit human RNase (ribonuclease)  
 CC H degradation of target RNA. This sequence is used in the exemplification  
 CC of the invention

 PT Concurrent interrogation of a number of polymorphic sites, useful for  
 PT genetic testing, carrier screening, genetic profiling, and identity  
 PT testing, comprises conducting a multiplexed elongation assay using  
 XX probes.  
 XX  
 PS Example 9; Page 46; 143pp; English.  
 XX  
 CC This invention relates to a novel method for the concurrent interrogation  
 CC of a number of polymorphic sites in the presence of, and without  
 CC interference from, non-designated polymorphic sites. Specifically, it  
 CC comprises conducting a multiplexed elongation assay by applying one or  
 CC more temperature cycles to achieve linear amplification of the target or  
 CC a combination of annealing and elongation steps under temperature-  
 CC controlled conditions. Furthermore, this detection method uses probe  
 CC extension or elongation and relies on enzymatic recognition, a superior  
 CC technique that no longer depends on differential hybridisation. The  
 CC present invention describes probes and methods useful for identifying or  
 CC detecting polymorphisms at one or more designated sites, such that they  
 CC can identify mutations within the cystic fibrosis conductance  
 CC transmembrane regulator (CFTR) or the human leukocyte antigen (HLA)  
 CC genes. In addition, concurrent interrogation of a multiplicity of  
 CC polymorphic sites is useful for genetic testing, carrier screening,  
 CC genotyping or genetic profiling, and identity testing. This  
 CC oligonucleotide is the negative control probe used for the elongation  
 CC mediated multiplexed analysis of HLA-DR, in an exemplification of the  
 CC invention.

 XX Amplifying for RNA in a sample, useful for improving RNA polymerase based  
 PT

PT RNA transcription from a polynucleotide template, comprises eliminating  
 PT single-stranded oligonucleotide from the transcription sample.  
 XX  
 XX Example 1; SEQ ID NO 8; 26pp; English.  
 PS  
 XX The invention relates to amplifying for RNA in a sample comprises  
 CC eliminating single-stranded oligonucleotide from the transcription  
 CC sample. The method involves synthesizing single-stranded cDNA by  
 CC incubating the sample RNA with reverse transcriptase and an  
 CC oligonucleotide primer that primes synthesis in a direction toward 5' end  
 CC of the RNA; converting the single-stranded cDNA into double-stranded cDNA  
 CC to form a transcription sample containing a cDNA template; eliminating  
 CC single-stranded oligonucleotide from the transcription sample; and  
 CC transcribing the cDNA template into RNA using an RNA polymerase. The  
 CC method is useful for improving RNA polymerase based RNA transcription  
 CC from a polynucleotide template. The method inhibits the undesired non-  
 CC template derived production of RNA in the transcription reaction.  
 CC Sequences ADI34483-ADI34489 represent oligonucleotides used in a T7 RNA  
 CC transcription reaction.

 XX Determining a functional property of fluid in chamber by introducing a  
 PT support comprising test elements having reaction and detection domains,  
 PT introducing a test fluid, and detecting locations not reactive with the  
 PT fluid.  
 XX  
 XX Example 2; SEQ ID NO 2; 22pp; English.  
 PS  
 XX The invention relates to a method of determining a functional property of  
 CC a fluid in a chamber comprising introducing into the chamber a support to  
 CC which is bound several test elements, each of the test elements  
 CC comprising a reaction domain and a detection domain, introducing into the

CC chamber a fluid that is interactive with the reaction domains, removing  
 CC the fluid from the chamber, determining by means of the detection domains  
 CC the locations at which the fluid has not interacted with the reaction  
 CC domains, and relating the locations to the functional property of the  
 CC fluid. The reaction domains involves nucleotides. The detection domain  
 CC comprises a member of a specific binding pair. The determining of the  
 CC step involves treating the test elements to modify only those reaction  
 CC domains that have interacted with the fluid. The functional property is  
 CC chosen from the flow pattern of the fluid, reagent distribution within  
 CC the fluid and time dependent reactivity of the fluid. The method is  
 CC useful for determining a functional property of a fluid in a chamber and  
 CC for synthesizing arrays of biopolymers e.g., arrays of polynucleotides.  
 CC The method provides for the characterisation of a new fluid in a known  
 CC flow cell, a known fluid in a new flow cell or a new fluid/flow cell  
 CC combination. This sequence represents a test element used in the method  
 CC of the invention.

 PT Synthesizing single stranded cDNA, involves annealing cDNA synthesis  
 PT primer to RNA and synthesizing first cDNA strand, ligating adaptor to  
 PT single stranded cDNA using DNA ligase, and amplifying ligated single  
 PT stranded cDNA fragment.  
 XX  
 PS Example 1; SEQ ID NO 6; 22pp; English.  
 XX  
 CC The invention describes a method of synthesising single stranded cDNA by  
 CC a 5'-ligated adaptor-mediated process involving: annealing a cDNA  
 CC synthesis primer to RNA, separating the cDNA strand from the RNA,  
 CC purifying the cDNA, contacting the cDNA with an adaptor, ligating the  
 CC adaptor through 5'-phosphate on strand (II) of the adaptor to single  
 CC stranded using DNA ligase, and amplifying the obtained ligated single  
 CC stranded fragment in an molecular amplification procedure. The method is  
 CC useful for: synthesising a single stranded cDNA by a 5'-ligated adaptor-  
 CC mediated process, where the source of nucleic acid is chosen from blood,

CC serum, plasma, cerebrospinal fluid, urine, tissue samples, biopsies and  
 CC saliva. The tissue sample comprises a cell population which may be single  
 CC cell, 100-1000000 cells or more as desired; making a cDNA library from a  
 CC collection of mRNA molecules in a sample, where the method is applied to  
 CC amplify the cDNAs corresponding to the mRNAs by annealing one or more  
 CC cDNA synthesis primers to several mRNAs in the sample; producing a  
 CC subtractive hybridisation probe which involves synthesising a double-  
 CC stranded cDNA collection from a first mRNA population by the method,  
 CC where primer 1 is modified by biotin in the 5' end, isolating the biotin-  
 CC containing single stranded cDNA (sense) by use of streptavidin coated  
 CC magnetic beads, synthesising a double-stranded cDNA collection from a  
 CC second mRNA population according to the method, isolating the non-biotin-  
 CC containing single stranded cDNA (anti-sense) by use of streptavidin  
 CC coated magnetic beads, hybridising the sense to the anti-sense cDNA,  
 CC where an unhybridised sub-population of the anti-sense cDNA is found,  
 CC isolating the unhybridised sub-population of the anti-sense cDNA by use of  
 CC streptavidin coated cDNA, and generating a second double-stranded cDNA  
 CC collection from the unhybridised sub-population by PCR using primer 1 and  
 CC primer 2; and detecting expression of a gene in a pre-selected cell  
 CC population. The method is an improved method for producing amplified  
 CC heterogeneous populations of cDNA from limited quantities of RNA or other  
 CC nucleic acid. This sequence represents a poly-A-tail used to in the  
 CC production single stranded cDNA.

XX Constructing synthetic polynucleotide for modulating the quality of a  
 PT selected phenotype displayed by an organism comprises replacing a first

codon with a synonymous codon to construct the synthetic polynucleotide.  
 Example 1; SEQ ID NO 77; 86pp; English.

XX The present invention describes a method for constructing a synthetic  
 CC polynucleotide from which a polypeptide is producible to confer a  
 CC selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the  
 CC same polypeptide. The method comprises: (a) selecting a first codon of  
 CC the parent polynucleotide for replacement with a synonymous codon, where  
 CC the synonymous codon is selected on the basis that it exhibits a  
 CC different phenotypic preference than the first codon in a comparison of  
 CC phenotypic preferences in test organisms or parts, where the test  
 CC organism are selected from organisms of the same species as the organism  
 CC of interest and organisms that are related to the organisms of interest;  
 CC and (b) replacing the first codon with the synonymous codon to construct  
 CC the synthetic polynucleotide. Also described: (1) a method for  
 CC determining the phenotypic preference of a first codon in an organism of  
 CC interest or its parts; (2) a synthetic polynucleotide constructed from  
 CC the method above; (3) an organism or interest or part containing a  
 CC synthetic polynucleotide constructed from the method above; (4) an  
 CC organism or interest or part containing a synthetic construct that  
 CC comprises a regulatory polynucleotide operably linked to a tandem repeat  
 CC of a first codon fused in frame with a reporter polynucleotide that  
 CC encodes a reporter protein, which produces, or is predicted to produce a  
 CC selected phenotype or a phenotype of the same class as the selected  
 CC phenotype in the organism or part; (5) a method of modulating the quality  
 CC of a selected phenotype that is displayed by an organism of interest or  
 CC part and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide; (6) a method of enhancing the quality of a  
 CC selected phenotype that is displayed by an organism of interest or part  
 CC and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide; and (7) a method of reducing the quality of a  
 CC selected phenotype that is displayed by an organism of interest or part  
 CC and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide. The method is useful for constructing a  
 CC synthetic polynucleotide from which a polypeptide is producible to confer  
 CC a selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the  
 CC same polypeptide. It is useful for modulating the quality of a selected  
 CC phenotype displayed by an organism or part. The present sequence encodes  
 CC a synthetic leader sequence, which is used in an example from the present  
 CC invention.

XX
XX Identifying and detecting nucleic acids, particularly DNA hybridization
XX probes, involves employing chain extending enzymes (e.g. telomerase) to
XX elongate probes to render them readily detectable.
XX
XX Example 1; Page 5; 10pp; English.
XX
XX The present invention describes a method for detecting a nucleic acid
XX probe, which comprises using chain extending enzymes to elongate probes.
XX The method comprises: (a) treating the sample with a chain terminating
XX reagent to prevent polynucleotide chain growth from the nucleic acid in
XX the sample; (b) contacting the sample with the probe containing a
XX terminus capable of elongation by a chain extending enzyme, where the
XX probe hybridises to the nucleic acid in the sample; (c) contacting the
XX sample with a chain extending enzyme and its substrates, which elongates
XX the probe; and (d) detecting the elongated hybridised probe. Also
XX described is a method comprising: (a) treating nucleic acid molecules or
XX modified nucleic acids in a sample with a reagent or reagents that render
XX the nucleic acid chains unextendable by a non-template-dependent enzyme;
XX (b) hybridising the treated molecules with a nucleic acid probe that
XX includes an extendable terminus, under conditions where hybrids form; and
XX (c) treating any hybrids formed with a non-template dependent chain
XX elongating enzyme and its substrates, where any hybridised probe is
XX extended. The method is useful for identifying and detecting nucleic
XX acids, particularly DNA hybridisation probes. The present sequence
XX represents a tailing reaction exemplary primer, which is used in an
XX example from the present invention

CC The invention relates to novel nuclease-resistant oligomeric compounds.
CC The compounds of the invention are useful as pharmaceuticals for topical
CC administration such as transdermal patches. The oligomeric compound is
CC resistant to enzymatic degradation. The sequences shown in AB275345-
CC AB275399 represent the nuclease-resistant compounds of the invention

CC New oligonucleotide comprising at least one 2',5'-internucleotide linkage
CC useful for treating organisms having disease caused by undesired
CC production of protein e.g. bacteria, yeast, protozoa and algae.
XX
PS Example 54; SEQ ID NO 7; 30pp; English.
XX
CC The invention describes an oligonucleotide comprising several nucleotides
CC covalently linked together by internucleotide linkages. At least one of
CC the nucleotides is linked to an adjacent nucleotide by 2',5'-
CC internucleotide linkage and bears a 3'-substituent. The oligonucleotides
CC are useful; as antisense oligonucleotides; in pharmaceutical production of
CC ; for treating organisms having disease caused by undesired production of
CC protein e.g. organism that utilises RNA-DNA transcription or RNA-protein
CC translation, bacteria, yeast, protozoa, algae and warm-blooded animals;
CC for developing diagnostic and therapeutic agents. The modified
CC oligonucleotide exhibits improved properties of nuclease resistance and
CC binding affinity. The oligonucleotides are easy to synthesise and exhibit
CC good properties of nuclease resistance and hybridisation to target
CC nucleic acids. The oligonucleotide is potent antisense agent with longer
CC duration of action. This sequence represents an oligonucleotide of the
CC invention.

XX DR An isolated nucleic acid molecule, comprising nucleic acid sequence of
XX PT Nicotiana derived cytochrome P450 enzyme fragments, useful for producing
XX PT transgenic plants.
XX PS Disclosure; Fig 73; 82pp; English.
XX CC The invention relates to an isolated nucleic acid molecule (I),
XX CC comprising a nucleic acid sequence chosen from 75 Nicotiana-derived
XX CC cytochrome P450 enzyme fragment sequences. (I) is useful for producing a
XX CC transgenic tobacco plant, which involves operably linking (I) with a
XX CC promoter functional in the plant to create a plant transformation vector,
XX CC and transforming the plant with the plant transformation vector,
XX CC selecting a plant cell transformed with the transformation vector, and
XX CC regenerating a plant from the selected plant cell. The nucleic acid
XX CC molecule is in an antisense orientation, sense orientation or is in a RNA
XX CC interference orientation. The present sequence represents a PCR primer
XX CC used to clone DNA encoding tobacco cytochrome P450 enzyme fragments of
XX CC the invention.

XX PT New stem cell factor polypeptide(s) - for stimulating the growth of
XX PT primitive progenitor cells, esp. for treating disorders involving blood
XX PS Example 3; Fig 12C; 127pp; English.
XX CC AAT04915-T04922 are oligonucleotide primers and probes used for the
XX CC amplification and sequencing of mammalian stem cell factor (SCF). Non-
XX CC naturally occurring SCF and C-terminally truncated polypeptides, having
XX CC amino acid sequences sufficiently duplicative of naturally occurring SCF,
XX CC stimulate growth of primitive progenitors such as haematopoietic
XX CC progenitor cells, neural stem cells and primordial germ stem cells. The
XX CC peptides can be used in a composition for treating leucopenia, anaemia or
XX CC thrombocytopenia, for enhancing engraftment of bone marrow during
XX CC transplantation or for bone marrow recovery after chemotherapy or
XX CC radiation-induced bone marrow aplasia or myelosuppression. They can also
XX CC be used for treating neoplasia, nerve damage, infertility, intestinal
XX CC damage or myeloproliferative disorders. Antibodies may be raised against
XX CC the peptides for use in detection or neutralisation of SCF in serum. SCF
XX CC may be useful for the treatment of AIDS and severe combined
XX CC immunodeficiency (SCID) states alone or in combination with other factors
XX CC such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)

 PT Enhancing efficiency of transfer of polynucleotide into a target  
 PT mammalian cell in vitro, involves exposing cell that expresses a stem  
 PT cell factor receptor to stem cell factor, and introducing polynucleotide  
 PT into cell in vitro.  
 XX  
 PS Example 3; Fig 12C; 210pp; English.  
 XX  
 CC The present invention describes a method for enhancing (E) the efficiency  
 CC of transfer of a polynucleotide (I) into a target mammalian cell (II) in  
 CC vitro, comprising exposing (II) that expresses a stem cell factor (SCF)  
 CC receptor to a biologically active SCF, its analogue or fragment, which  
 CC induces cell proliferation, and introducing (I) to (II) in vitro.  
 CC Exposure of SCF to (II) results in increased uptake of (I) into the cell.  
 CC The method is useful for enhancing the efficiency of the transfer of a  
 CC polynucleotide into a target mammalian cell in vitro. The method is  
 CC useful in gene therapy techniques. AAH41301 to AAH41364 and AAB98351 to

 CC The present sequence for universal PCR primer 220-3 is 1 of 8 universal  
 CC oligonucleotides (AAS04110-AAS04117) used in the isolation of the human  
 CC SCF (stem cell factor) cDNA sequence. The present invention relates to  
 CC novel stem cell factors (AAU02453-AAU02458, AAU02460, AAU02461) and the  
 CC polynucleotides encoding them. SCF stimulate primitive progenitor cells  
 CC including early haematopoietic progenitor cells. The invention also  
 CC describes SCF peptides (AAU02462-AAU02481) and the oligonucleotides  
 CC (AAS04081-AAS04117) used in the isolation of human and rat SCF sequences.  
 CC The polynucleotide encoding SCF is useful for producing SCF and useful in  
 CC gene therapy. It is useful for treating disorders involving blood cells  
 CC such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple  
 CC myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia,  
 CC congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis,

PT Novel non-naturally-occurring stem cell factor polypeptide, useful for
PT treating leucopenia, thrombocytopenia, anemia and for enhancing
PT engraftment of bone marrow during transplantation in a mammal.
XX
PS Example 3; Fig 12C; 217pp; English.
XX
CC The present invention relates to novel non-naturally-occurring stem cell
CC factor (SCF) polypeptides having an amino acid sequence sufficiently
CC duplicative of that of naturally-occurring SCF to allow possession of
CC haematopoietic biological activity of naturally occurring SCF. Sequences
CC of the invention are useful for treating leucopaenia, thrombocytopenia,
CC anaemia and for enhancing bone marrow recovery in treatment of radiation,
CC engraftment of bone marrow during transplantation in mammals and chemical
CC or chemotherapeutic induced bone marrow aplasia or myelosuppression. They
CC are also useful for treating acquired immune deficiency in a human, nerve
CC damage, neoplasia, infertility, myeloproliferative disorder, intestinal
CC active polymer polypeptide adduct, for enhancing preparation of early
CC haematopoietic progenitor cells with a gene, and transfer of a gene into
CC a mammal. They are useful for treating myelofibrosis, myelosclerosis,
CC osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma,
CC Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease,
CC Letterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo
CC syndrome, congestive splenomegaly, Kala azar, sarcoidosis, primary
CC splenic pancytopenia, disseminated fungus disease, malaria, military
CC tuberculosis, Fulminating septicaemia, pyridoxine deficiency, vitamin B12
CC and folic acid deficiency, Diamond Blackfan anaemia, hypopigmentation
CC disorders such as piebaldism, AIDS (acquired immune deficiency syndrome)
CC and vitiligo. The present sequence is a PCR primer which is used for
CC amplifying the 5' end of rat SCF cDNA. This sequence is used in the
CC exemplification of the invention

 PT New non-natural stem cell factor, useful for treating e.g. leucopenia or  
 PT immune deficiency, also related nucleic acid and antibodies.  
 PS  
 PS Disclosure; SEQ ID NO 32; 217pp; English.  
 XX  
 CC The invention relates to stem cell factor (SCF) polypeptides with  
 CC haematopoietic activity and the polynucleotides encoding them. The  
 CC polypeptides are used for treating infertility, intestinal damage,  
 CC myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia,  
 CC for improving engraftment of bone marrow transplants, for enhancing bone  
 CC marrow recovery after radiotherapy or chemotherapy and in treatment of  
 CC immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic  
 CC carcinoma, leukaemia and military tuberculosis. The SCF polypeptides are  
 CC also used to expand haematopoietic progenitor cells for transplantation  
 CC and to prepare such cells for transfection with a gene. The SCF  
 CC polynucleotides can be used for recombinant expression of the  
 CC polypeptides and also as probes for mapping of the SCF gene, for  
 CC identifying SCF-related diseases and as a marker for neighbouring genes.  
 CC Antibodies raised against the polypeptides are useful in diagnosis and to  
 CC remove SCF from blood. This sequence represents SCF related DNA of the  
 CC invention.

 PT Pharmaceutical composition for treating ailments associated with impaired  
 PT respiration, has oligo(s) antisense to specific gene(s) or its  
 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or  
 PT ubiquinone.  
 XX  
 PS Disclosure; SEQ ID NO 5138; 872pp; English.  
 XX  
 CC The invention relates to a novel pharmaceutical composition, which has a  
 CC first active agent comprising an oligonucleotide antisense to the  
 CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
 CC junctions of genes encoding a polypeptide associated with lung and/or  
 CC nasal airway dysfunction and a second active agent comprising an  
 CC antiinflammatory steroid and ubiquinone. A composition of the invention  
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
 CC immunosuppressive, and cytosstatic activity. The composition may have a  
 CC use in antisense gene therapy. The composition is useful for treating or  
 CC preventing a respiratory, lung or malignant disease or condition, also  
 CC for enhancing the prophylactic or therapeutic respiratory effect of an  
 CC antiinflammatory steroid in a subject, for reducing or depleting levels  
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
 CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
 CC lung inflammation, lung allergies, or a respiratory disease or condition.  
 CC Note: The sequence data for this patent is not represented in the printed  
 CC specification, but was obtained in electronic format directly from WIPO

 XX Pharmaceutical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.  
 XX Claim 15; SEQ ID NO 4961; 763pp; English.  
 XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has antiallergic, antiinflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

PT with Navi.3, e.g. pain, seizure disorder such as childhood seizure
PT disorder, or ataxia.
XX PS Claim 4; SEQ ID NO 2172; 417pp; English.
XX CC The present invention relates to an antisense compound targeted to a
CC nucleic acid molecule encoding Navi.3, where the antisense compound
CC specifically hybridizes with and inhibits the expression of Navi.3. The
CC compound and composition are useful for treating a disease or condition
CC associated with Navi.3, e.g. pain including but not limited to
CC neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,
CC diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,
CC pain from burns, migraine headache, cluster headache, mild-to-moderate
CC headache; seizure disorder such as childhood seizure disorder, including
CC but not limited to neonatal or infantile epilepsy; or ataxia. The present
CC sequence represents a chimeric phosphorothioate oligonucleotide with
CC 2'MOE wings and a deoxy gap. Used during the antisense inhibition of
CC human Navi.3 expression, the oligonucleotides are designed to target
CC different regions of the human Navi.3 RNA.

XX New antisense compound, having a sequence targeted to a nucleic acid
PT encoding mPGES-1, useful for preparing a composition for treating e.g.,
PT inflammation, Alzheimer's disease, arthritis, diabetes, cancer or
PT ischemia.
XX Claim 4; SEQ ID NO 654; 132pp; English.
XX The present sequence represents a chimeric antisense oligonucleotide
CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC human mPGES-1 gene is located on chromosome 9, more specifically to
CC 9q34.3. The present invention also describes: (1) antisense compounds,
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC inhibits its expression; (2) a method of inhibiting the expression of
CC mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC having a disease or condition associated with mPGES-1. mPGES-1 chimeric
CC antisense oligonucleotides and antisense compounds have cytostatic,
CC antidiabetic, immunomodulator, cardiant, neuroprotective,
CC antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC ophthalmological, immunomodulatory and cardiovascular activities, and can
CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC can be used for preparing a composition for treating a disease or
CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC ophthalmic, immunological, cardiovascular or neurological disorder.

 XX Preparing a human stem cell factor (SCF) polypeptide, useful for treating  
 PT hematopoietic disorders, e.g., aplastic anemia, comprises growing host  
 PT cells transformed or transfected with DNA encoding a human SCF.  
 XX Example 3; SEQ ID NO 32; 210pp; English.  
 XX The invention relates to preparing a (vertebrate) human stem cell factor  
 CC (SCF) polypeptide comprising growing host cells transformed or  
 CC transfected with DNA encoding a human SCF that stimulates growth of  
 CC haematopoietic progenitor cells under nutrient conditions, the DNA being  
 CC operatively linked to an expression control sequence, and isolating the  
 CC polypeptide produced. Also included is a recombinant host cell  
 CC transformed or transfected with an expression construct comprising a  
 CC vertebrate SCF polypeptide-encoding DNA operatively linked to a  
 CC heterologous expression regulatory sequence, permitting the expression of  
 CC the vertebrate SCF polypeptide in the host cell. Disclosed as new are rat  
 CC and human nucleic acids encoding SCF, SCF proteins from a number of other  
 CC mammals and recombinantly expressed SCF protein fragments. The DNA  
 CC sequences are useful for effecting the large scale synthesis of SCF by a  
 CC variety of recombinant techniques or for generating new and useful viral  
 CC and circular plasmid DNA vectors, new and useful transformed and  
 CC transfected prokaryotic and eukaryotic host cells, and new and useful  
 CC methods for cultured growth of such host cells capable of expression of  
 CC SCF and its related products. The DNA sequences are also useful as  
 CC labelled probes in isolating human genomic DNA encoding SCF, in methods  
 CC of protein synthesis, in genetic therapy in humans and other mammals, and  
 CC in developing transgenic mammalian species which may serve as eukaryotic  
 CC hosts for production of SCF and SCF products in quantity. The SCF is  
 CC useful for treating haematopoietic disorders, e.g., aplastic anaemia,  
 CC paroxysmal nocturnal haemoglobinuria, myelofibrosis, myeloclelerosis,  
 CC osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma,  
 CC Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease,

CC Letterer-Siwe disease, refractory erythroblastic anaemia, Di Guglielmo  
 CC syndrome, congestive splenomegaly, Kala awar, sarcoidosis, primary  
 CC splenic pancytopenia, miliary tuberculosis, disseminated fungus disease,  
 CC Fulminating septicemia, malaria, vitamin B12 and folic acid deficiency,  
 CC pyridoxine deficiency, Diamond Blackfan anaemia, and hypopigmentation  
 CC disorders such as piebaldism and vitiligo. The SCF are also useful for  
 CC treating neurological damage, infertility states, intestinal damage  
 CC resulting from irradiation or chemotherapy, and AIDS. SCF is also useful  
 CC for enhancing haematopoietic recovery after acute blood loss and as a  
 CC boost to the immune system for fighting neoplasia (cancer). The present  
 CC sequence is a universal SCF PCR primer used in the isolation of SCF DNA.

 XX  
 PS Example; Page 5; 8pp; German.  
 XX  
 CC This invention describes a novel method for sorting single-stranded  
 CC nucleic acids by isolation and hybridisation of nucleic acid pools, then  
 CC reading out, where the nucleic acids are selectively bound using capture  
 CC agents that are (a) immobilised on the surface of a solid matrix and (b)  
 CC comprise variable and non-variable regions. The capture oligonucleotides  
 CC have a 5'-invariable anchor region, the complement of which is present at  
 CC least once in each nucleic acid and a 3'-variable, discriminatory region  
 CC that comprises all possible combinations of up to 10 nucleotides to allow

CC binding of particular sorts of single stranded nucleic acids. The capture  
 CC agents are particularly locked nucleic acids (LNA) and the anchor region  
 CC comprises a sequence of 10-50, particularly 15-25, T residues. The  
 CC capture oligonucleotides are biotinylated and immobilised on a surface by  
 CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,  
 CC metal, resin, gel, crystalline material and/or membrane, having semi-  
 CC conducting properties and especially in the form of a chip. Its surface  
 CC is particularly a layer of (bio)molecular filaments and binding of single  
 CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,  
 CC physical, stimulated by an electrical field or through a molecular sieve.  
 CC The method is used (i) for analysis of patterns, especially in mucosal,  
 CC hair root, blood, nerve or germ cells and (ii) for determining the  
 CC activity of pharmaceuticals and/or nutritional compounds, e.g. food  
 CC additives or supplements, especially minerals, trace elements, organic  
 CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and  
 CC mixtures. The method provides rapid, inexpensive and reproducible  
 CC representation of differences in pools of nucleic acids from cells. It  
 CC allows imaging of the complete pattern of all nucleic acids in a cell, and  
 CC method is based on comparison of nucleic acid pools, not individual  
 CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent  
 CC capture probes used in the method of the invention.

comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acids in a cell, and can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.

CC This invention describes a novel method for sorting single-stranded
CC nucleic acids by isolation and hybridisation of nucleic acid pools, then
CC reading out, where the nucleic acids are selectively bound using capture
CC agents that are (a) immobilised on the surface of a solid matrix and (b)
CC comprise variable and non-variable regions. The capture oligonucleotides
CC have a 5'-invariable anchor region, the complement of which is present at
CC least once in each nucleic acid and a 3'-variable, discriminatory region
CC that comprises all possible combinations of up to 10 nucleotides to allow
CC binding of particular sorts of single stranded nucleic acids. The capture
CC agents are particularly locked nucleic acids (LNA) and the anchor region
CC comprises a sequence of 10-50, particularly 15-25, T residues. The
CC capture oligonucleotides are biotinylated and immobilised on a surface by
CC interaction with streptavidin. The matrix is of plastic, ceramic, glass,
CC metal, resin, gel, crystalline material and/or membrane, having semi-
CC conducting properties and especially in the form of a chip. Its surface
CC is particularly a layer of (bio)molecular filaments and binding of single
CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular,
CC physical, stimulated by an electrical field or through a molecular sieve.
CC The method is used (i) for analysis of patterns, especially in mucosal,
CC hair root, blood, nerve or germ cells and (ii) for determining the
CC activity of pharmaceuticals and/or nutritional compounds, e.g. food
CC additives or supplements, especially minerals, trace elements, organic
CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and
CC mixtures. The method provides rapid, inexpensive and reproducible
CC representation of differences in pools of nucleic acids from cells. It
CC allows imaging of the complete pattern of all nucleic acid in a cell, and
CC can detect very small differences in the nucleic acid pool. Since the
CC method is based on comparison of nucleic acid pools, not individual
CC genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
CC capture probes used in the method of the invention.

PT

```

XX PS Claim 1; Page 4; 14pp; German.

CC This invention describes a novel method of determining a predisposition to disease by genotyping a subject's DNA sequence (A) of the human mismatch repair gene, MSH6 at specified positions and comparing with reference DNA sequences, optionally taking into account all possible combinations of variations of the individual mutations, including any chosen absolute number of variations. (A), and analysis of their sequences, are useful for the following: (i) determining a predisposition to disease, especially colorectal, endometrial and ovarian carcinoma and leukemia; (ii) determining an increased mutation rate (frequency of base substitutions, insertions and/or deletions) in eukaryotic cells; (iii) predicting the progression, severity and survival time of patients with neoplastic disease; (iv) the development of therapeutic and 'life-style' drugs; (v) predicting individual differences in response to known chemotherapeutic agents (e.g. cis-platin) or drugs developed from (iv); (vi) optimizing individual treatments and interventions against neoplasia; (vii) controlling the mutation rate in eukaryotic cells, in vitro or in vivo; (viii) constructing genes and vectors, particularly for development of pharmaceuticals; (ix) developing diagnostic kits and other systems for genotyping; and (x) developing in vivo and in vitro test systems for expressing individual forms of the MSH6 gene, e.g. for studying pathophysiology of disease or processes in which MSH6 is involved, and for drug development and testing

DR Measuring telomerase activity, useful for tumour diagnosis and compound screening - by extending substrate primer, followed by amplification and immobilising product for detection.  
XX Example; Page 11; 21pp; German.

CC The present sequence is a telomerase Oligo-dT-Primer, which can be used in a novel method for detecting telomerase activity. The method comprises adding to a test sample a 1st primer, that serves as telomerase substrate, and nucleoside triphosphate (dNTP) and incubating to allow primer extension by the telomerase, amplifying the extension product, immobilising the amplification product (AP) on a solid phase and qualitative and/or quantitative detection of AP, where the substrate primer is preferably from the 5'-region of the long terminal repeat 2 (LTR-2) sequence of a retrovirus. The method can be used to diagnose tumours and screen compounds for effector activity. Immobilisation of AP provides a signal that is reproducibly representative of telomerase activity, eliminates the need for gel electrophoretic separation and provides high sensitivity. Radioactive labels are not required and the method can be automated for routine use. Specific detection is achieved by proper choice of hybridisation conditions, without separation of the telomerase extension product. A specific signal is generated by 1-10 cell equivalents, but for tumour analysis 10-1000 ng of tissue is usually used

PT Analysis of cDNA and gene expression - by amplification of mRNA followed
PT by digestion with restriction enzymes.
XX
PS Disclosure; Page 6; 11pp; Japanese.
XX
CC A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC and using the aggregate of mRNAs as the template for each reverse
CC transcription primer; (b) digesting each of the prepared aggregates of
CC the double-stranded cDNAs with restriction enzyme and; (c)
CC electrophoresing the digested aggregate of cDNAs in separate lanes. The
CC method can be used to analyse gene expression rapidly and easily

 XX Identifying target genes for allele-specific drugs - used for diagnosis,  
 PT prevention and treatment of, e.g. cancers, atherosclerotic plaque,  
 PT dysplastic lesions, endometriosis or graft versus host disease.  
 XX  
 PS Disclosure; Fig 7; 605pp; English.  
 XX  
 CC This invention describes a novel method for identifying an inhibitor  
 CC potentially useful for treatment of cancer, where the inhibitor is active  
 CC on a gene vital for cell growth or viability, and where the gene is  
 CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is  
 CC used for preventing the development of cancer in a patient having a  
 CC precancerous condition, by administering to the patient a first allele  
 CC specific inhibitor (ASI) targeted to an allele of a first essential gene  
 CC present in cells of the precancerous condition, where the normal somatic  
 CC cells of the patient are heterozygous for the first gene, the inhibitor  
 CC is active on at least one but less than all allelic forms of the gene  
 CC present in a population and targets only one allelic form present in the  
 CC normal somatic cells, and the first gene. The products and methods can be  
 CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.  
 CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic  
 CC lesions, benign tumours, endometriosis, polycystic kidney disease, and  
 CC graft versus host disease. The method can also be used to remove  
 CC malignant cells from bone marrow transplants. AAZ25812-Z26825 represent  
 CC human polymorphic sites described in the method of the invention

 XX New modified antisense oligonucleotide, useful particularly for treating  
 PT prostatic cancer, inhibits the testosterone-repressed prostate message-2.  
 XX  
 PS Example 13; Page 20; 44pp; English.  
 XX  
 CC The invention relates to a compound consisting of an oligonucleotide with  
 CC a phosphorothioate backbone throughout, in which: (a) sugars on  
 CC nucleotide residues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the  
 CC remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at  
 CC positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence  
 CC ACF36398 (I) is used: (a) to delay progression of androgen-sensitive  
 CC prostatic cancer cells to the androgen-independent state, in vivo or in  
 CC vitro; (b) to treat prostatic cancer (after initially withdrawing  
 CC androgens to induce apoptosis); and (c) to increase sensitivity of cancer  
 CC cells (prostatic, renal, non-small cell lung, urothelial transitional,  
 CC ovarian and some breast cancer cells) that express abnormal levels of  
 CC TRPM-2 to chemotherapy or radiation. The modifications present in (I)  
 CC increase stability in vivo and activity (both in vivo or in vitro) and  
 CC result in a synergistic increase in effect when (I) is used with  
 CC chemotherapeutic agents or other antisense oligonucleotides directed  
 CC against other antiapoptotic genes. The present sequence represents a  
 CC mismatch control oligonucleotide, used in antisense assays of anti-  
 CC apoptotic protein TRPM-2 (testosterone-repressed prostate message-2)

PT Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells
PT that expresses testosterone-repressed prostate message-2 (TRPM-2)
PT comprises administering a composition that inhibits expression of TRPM-2.
XX
PS Disclosure; SEQ ID NO 15; 14pp; English.
XX
CC The present invention provides a method for treating cancer in which
CC cancer cells express testosterone-repressed prostate message-2 (TRPM-2).
CC The invention is useful for enhancing the chemo-sensitivity or radiation-
CC sensitivity of cancer cells for treating cancer such as prostate cancer,
CC bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma
CC (RCC). The invention is also useful in antisense gene therapy. The
CC present sequence is control testosterone-repressed prostate message-2
CC (TRPM-2) mismatch oligonucleotide. The oligonucleotide is used in the
CC exemplification of the invention.

XX  
CC The invention relates to a novel pharmaceutical composition, which has a  
CC first active agent comprising an oligonucleotide antisense to the  
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
CC junctions of genes encoding a polypeptide associated with lung and/or  
CC nasal airway dysfunction and a second active agent comprising an  
CC antiinflammatory steroid and ubiquinone. A composition of the invention  
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
CC immunosuppressive, and cytostatic activity. The composition may have a  
CC use in antisense gene therapy. The composition is useful for treating or  
CC preventing a respiratory, lung or malignant disease or condition, also  
CC for enhancing the prophylactic or therapeutic respiratory effect of an  
CC antiinflammatory steroid in a subject, for reducing or depleting levels  
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
CC lung inflammation, lung allergies, or a respiratory disease or condition.

 PT bronchodilating agent.

XX

PS Claim 15; SEQ ID NO 5114; 763pp; English.

CC This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has antiallergic, antiinflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytosolic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.

CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc. tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.  
 XX Claim 15; SEQ ID NO 4180; 763pp; English.  
 XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a

CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC of the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc. tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 XX Pharmaceutical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.  
 XX Claim 15; SEQ ID NO 911; 763pp; English.  
 XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a

comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

PT with Nav1.3, e.g. pain, seizure disorder such as childhood seizure
PT disorder, or ataxia.
XX
PS Claim 4; SEQ ID NO 3800; 417pp; English.
XX
The present invention relates to an antisense compound targeted to a
CC nucleic acid molecule encoding Nav1.3, where the antisense compound
CC specifically hybridizes with and inhibits the expression of Nav1.3. The
CC compound and composition are useful for treating a disease or condition
CC associated with Nav1.3, e.g. pain including but not limited to
CC neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,
CC diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,
CC pain from burns, migraine headache, cluster headache, mild-to-moderate
CC headache; seizure disorder such as childhood seizure disorder, including
CC but not limited to neonatal or infantile epilepsy; or ataxia. The present
CC sequence represents a chimeric phosphorothioate oligonucleotide with
CC 2'MOE wings and a deoxy gap. Used during the antisense inhibition of
CC human Nav1.3 expression, the oligonucleotides are designed to target
CC different regions of the human Nav1.3 RNA.

 PS Disclosure; Page 7; 11pp; Japanese.  
 XX  
 CC A method for the analysis of cDNA comprises (a) preparing an aggregate of  
 CC double-stranded cDNAs by using an aggregate of mRNAs and a plural type of  
 CC labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)  
 CC and using the aggregate of mRNAs as the template for each reverse  
 CC transcription primer; (b) digesting each of the prepared aggregates of  
 CC the double-stranded cDNAs with restriction enzyme and; (c)  
 CC electrophoresing the digested aggregate of cDNAs in separate lanes. The  
 CC method can be used to analyse gene expression rapidly and easily

CC This invention describes a novel method for identifying an inhibitor  
 CC potentially useful for treatment of cancer, where the inhibitor is active  
 CC on a gene vital for cell growth or viability, and where the gene is  
 CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is  
 CC used for preventing the development of cancer in a patient having a  
 CC precancerous condition, by administering to the patient a first allele  
 CC specific inhibitor (ASI) targeted to an allele of a first essential gene  
 CC present in cells of the precancerous condition, where the normal somatic  
 CC cells of the patient are heterozygous for the first gene, the inhibitor  
 CC is active on at least one but less than all allelic forms of the gene  
 CC present in a population and targets only one allelic form present in the  
 CC normal somatic cells, and the first gene. The products and methods can be  
 CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.  
 CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic  
 CC lesions, benign tumours, endometriosis, polycystic kidney disease, and  
 CC graft versus host disease. The method can also be used to remove  
 CC malignant cells from bone marrow transplants. AAZ25812-226825 represent  
 CC human polymorphic sites described in the method of the invention

XX Pharmaceutical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.

XX Claim 15; SEQ ID NO 4945; 763bp; English.

CC This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, cancer.  
 CC Transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding of  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 PT mechanism of development of tissue or organ of sea squirt.

XX PS Disclosure; Page 38; 1846pp; Japanese.

CC This invention relates to novel genes and the encoded proteins thereof

CC that are derived from the sea squirt Ciona intestinalis. Specifically, it

CC refers to those genes that are expressed in the tissues or organs of the

CC sea squirt during its developmental phase. The present invention

CC describes the identification of these genes as useful for elucidation of

CC the mechanism of development and hence for developing regeneration

CC medicines and gene therapy techniques. Accordingly, they can be used in

CC the research of various genetic diseases, as well as the analysis of cell

CC proliferation, differentiation and reproduction. Furthermore, such

CC compositions can be useful for environmental measurements and water

CC surveys, particularly for sea water surveys, and also for the preparation

CC of transformed sea squirt for improving edibility of sea squirt such as

CC Halocynthia roretzi. This oligonucleotide sequence is a PCR primer used

CC to amplify sea squirt DNA given in an exemplification of the invention.

XX Detection and characterisation of mRNA by restriction display PCR -

PT comprising synthesis of cDNA, digestion with a restriction endonuclease,

PT ligation to an adaptor DNA and PCR amplification.

XX Disclosure; Page 24; 40pp; English.

XX A method has been improved for detecting and characterising mRNA

CC molecules which includes synthesising a double stranded (ds) cDNA from

CC isolated mRNA, digesting the ds cDNA with a restriction endonuclease to

CC produce cDNA fragments in which at least one end of the cDNA fragments

CC has a sequence capable of hybridising to an adaptor DNA sequence. The

CC improvement comprises: (a) hybridising adaptor DNA sequences to at least

CC one end of the cDNA fragments; (b) ligating the adaptor DNA sequences to

CC the cDNA fragments; (c) amplifying the cDNA fragments having ligated

CC adaptor DNA sequences by a PCR using primers that hybridise to the ends

CC of the cDNA fragments, where the primers have at least one nucleotide at

CC the 3' end that specifically hybridises to a subset of cDNA molecules;

CC and (d) detecting the presence of the resulting amplified cDNA fragments.

CC The present sequence represents a template poly-A tail used in the present

CC specification. The method designates restriction display PCR can be used

CC for characterising cells based on their mRNA content, for representing

CC expressed genes, and for discovery of therapeutics that alter cellular

CC gene expression. The method is also useful for characterising cells of a

CC variety of types and under a variety of physiological conditions. The

CC method is also useful for identifying cells or tissue from particular

CC individuals or species based on the fingerprint obtained from the mRNA

CC content of isolated cells or tissue and comparing it to cells or tissue

CC from a known source

XX Peptides having at least two new nucleotides - useful as primers in RT-

PT PCR.

XX Example 1; Page 12; 19pp; Japanese.

XX This sequence represents a primer of the invention. The invention relates

CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta

CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or

CC a nucleotide with volutary sequence; m = 0 or 1; alpha = thymine; n =

CC natural number indicating the repetition of alpha; beta, delta = V or N;

CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or

CC thymine; gamma = thymine; k = natural number of 3 or over indicating the

CC repetition of gamma, in which thymine expressed by gamma is composed of

CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are

CC useful as primers for RT-PCR and determination of base sequences. The new

CC sequences allow for reproductive and highly efficient analysis of gene

XX  
XX The present invention describes nucleic acids (A) that interact stably  
XX with a target sequence and contain at least one phosphorodithioate  
XX link, having endonuclease activity. (A) and more generally any catalytic  
XX nucleic acid (A') that modulates expression of the oestrogen receptor  
XX gene, are used to treat cancer (particularly of breast or endometrium),  
XX

CC in vivo or by transforming cells ex vivo and implanting treated cells, or  
 CC for other conditions associated with levels of oestrogen receptor.  
 CC Because of the high selectivity for targeted RNA, (A) can also be used to  
 CC correlate inhibition of gene expression with alterations in phenotype,  
 CC particularly for identification of therapeutic targets, and as research  
 CC reagents (for RNA, in the same way that restriction endonucleases are  
 CC used with DNA). The combination of modifications in (A) improves  
 CC resistance to nucleases, binding affinity and/or activity. AAA23503 to  
 CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and  
 CC AAA24747 to AAA25992 represent their corresponding target sequences.  
 CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme  
 CC sequences, and AAA26107 to AAA26218 represent their corresponding target  
 CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and  
 CC antisense oligonucleotides used in the exemplification of the present  
 CC invention

 PT Retroviral expression vector, useful in gene therapy, contains a promoter  
 PT from a human endogenous retrovirus to provide cell-specific expression.  
 XX  
 PS Disclosure; Page 27; 67pp; German.  
 XX

CC This invention describes a novel retroviral expression vector (A)  
 CC containing DNA sequences (I) for packaging vector RNA and for cell-  
 CC specific expression of proteins or peptides encoding by heterologous DNA  
 CC (II). The sequences controlling cell-specific expression contain a cell-  
 CC specifically regulatable promoter region (P) from a human endogenous  
 CC retrovirus (HERV) DNA sequence. The invention also describes (a) mRNA and  
 CC RNA of (A); (b) prokaryotic and eukaryotic cells containing (A); (c)  
 CC eukaryotic cells containing (A) in integrated form; (d) virions  
 CC containing a retroviral expression vector RNA derived from (A); (e) a  
 CC method for producing the virions of (d); (f) a method for incorporating  
 CC protein-encoding nucleic acid sequences into a eukaryotic cell by

CC infection with the virions of (d); and (g) a retroviral vector system  
 CC containing (A) and a packaging cell line, that contains at least one  
 CC (recombinant) retrovirus construct that encodes for the packaging  
 CC proteins of (A). (A) are used for cell- or tissue-specific expression of  
 CC foreign genes for gene therapy and to produce virions for introducing  
 CC (II) into the chromosomal DNA of eukaryotic cells, preferably mammalian  
 CC and specifically human. (A) retain the advantages of usual retroviral  
 CC promoters with all the signal structures required for transcription in a  
 CC small region within the U3-R segment, but without their disadvantages  
 CC (excessive strength and limited cell specificity). Since (A) are derived  
 CC from endogenous (harmless) viral sequences, they do not introduce any new  
 CC viral sequences into the genome and recombination will not create new  
 CC types of retrovirus. The promoters provide cell or tissue specific  
 CC expression, according to which HERV they are derived from  
 CC

 PT Preparation of mixed backbone oligomeric compounds useful as e.g. primers  
 PT for diagnostic tests, involves oxidation of H-phosphonate internucleoside  
 PT linkages to phosphodiester internucleoside linkages.  
 XX  
 PS Example 12; Page 34; 49pp; English.  
 XX

CC The present sequence is that of a phosphorothioate oligonucleotide  
 CC containing 20' nucleobases, each having a 2'-methoxyethoxy group on its  
 CC 5' ribosyl sugar moiety. It is an example of an oligomeric compound  
 CC produced according to the methods of the invention. The invention  
 CC provides compounds and methods for the preparation of mixed backbone

oligomeric, or chimeric, compounds having phosphodiester internucleoside linkages in addition to phosphorothioate and/or phosphoramidate internucleoside linkages. The methods also include incorporation of boranophosphate internucleoside linkages. The methods utilize H-phosphonate intermediates that are coupled together forming contiguous regions of 1 or more H-phosphonate internucleoside linkages. Each contiguous region is subsequently oxidized to phosphodiester, phosphorothioate, phosphoramidate or boranophosphate internucleoside linkages prior to further elongation. Mixed backbone oligomeric compounds are prepared in this manner by oxidizing adjacent regions with different reagents. Oligomeric compounds of the invention are prepared using novel oxidation steps that oxidize a region of 1 or more H-phosphonate internucleoside linkages without degrading existing linkages that have been previously oxidized. The oligonucleotides obtained are useful as primers in PCR, probes, linkers, gene fragments and for other diagnostic tests on e.g. biological tissue, fluid, cells etc., as research reagents, and as antiviral agents

DR Providing mRNA profile, by generating two independent patterns  
PT characteristic of sample mRNA population, analyzing patterns, comparing  
PT gene expression by cell types under varied conditions, and identifying  
PT genes.

XX Disclosure; Fig 2; 67pp; English.

The present invention relates to a method for providing a profile of mRNA molecules present in a sample. The method comprises generating two independent patterns characteristic of the population of mRNA molecules expressed in the sample and analysing the patterns using a combinatorial algorithm, comparing gene expression by different or same cell types under different conditions, and identifying genes having a role in

various cellular processes. The method is useful for the analysis and identification of transcribed genes, and fingerprinting. The method can be used to identify genes which play a role in determining various cellular processes, including susceptibility to external factors, development, and disease. The present sequence for a PCR primer is used in the production of a single pattern characteristic of a sample, employing a Type IIS restriction enzyme (i.e. FokI) in the methods of the present invention

DR New isolated nucleic acid, useful for treating viral diseases associated  
PT with tumors and cell degeneration, also related polypeptides, antibodies  
PT and transfected cells.

XX Disclosure; Page 63; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in

CC patient samples is useful for diagnosis and/or prognosis of these  
CC diseases. The polypeptides can also be used to generate antibodies, and  
CC both the polypeptide and antibodies are useful as components of protein  
CC chips. The nucleic acid sequences of the invention can be used in gene  
CC therapy. This polynucleotide sequence represents a tumour suppression  
CC related human fukutin oligonucleotide of the invention

PT New zinc finger-containing proteins and nucleic acids, useful in  
PT manufacturing a medicament for treating or preventing a disorder  
PT associated with decreased or increased expression or activity of MD23,  
PT MD24, MD27 or MD212, e.g. cancer.  
XX  
PS Example 8; SEQ ID NO 5257; 103pp; English.  
XX  
CC The present invention relates to novel human zinc finger-containing  
CC proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is  
CC encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2,  
CC MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome  
CC 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy,  
CC or in manufacturing a medicament for treating or preventing a disorder  
CC associated with decreased or increased expression or activity of MD23,  
CC MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic  
CC acids and proteins are also useful for diagnosing or monitoring a disease  
CC caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic  
CC acids can also be used as probes to detect and characterize gross  
CC alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are  
CC useful in constructing microarrays for measuring gene expression. The  
CC proteins are useful as therapeutic agents for gene therapy or as  
CC vaccines. The present sequence was used to illustrate the invention.

DR Determining polyadenylation sites within transcribed gene sequences
XX PT present in a sample comprises assigning to gene fragments gene candidates
XX PT within a database by comparing signals in the dataset with the database.
XX PS Example; Fig 3; 81pp; English.
XX
CC The invention relates to determining the presence of and/or identifying a
CC polyadenylation site within a sequence of a transcribed gene or variants
CC present in a sample. The method involves assigning to gene fragments gene
CC candidates within a database by comparing signals in the dataset with the
CC database, the database comprising data representing mRNAs with known
CC polyA sites and/or 'virtual genes' representing a possible
CC polyadenylation site within an actual gene. The method is useful for
CC determining the presence of and/or identifying a polyadenylation site or
CC alternative polyadenylation sites within a sequence of a transcribed gene
CC or sequences of transcribed gene variants present or potentially present
CC in a sample, in identifying gene features, particularly in identifying
CC differences between sequence variants that occur in a population of
CC nucleic acid molecules, especially in identifying or discovering polyA
CC site usage or determining polyA site usage in a nucleic acid sample, and
CC gene variants arising from alternative polyA sites. The present sequence
CC represents a double stranded product DNA fragment

PT New nucleic acid encoding human prostate membrane-specific antigen,  
PT useful e.g. for treatment of tumors and viral infection, also related  
PT polypeptide and antibodies.  
PS Disclosure; Page 737; 771pp; French.  
XX  
CC The invention relates to the isolation of 6327 nucleotide sequences,  
CC fragments of at least 15 consecutive nucleotides of these nucleotides, a  
CC sequence having at least 80% identity, after optimal alignment, with the  
CC nucleotides, a sequence that hybridizes under stringent conditions with  
CC the nucleotides, or the complement, or corresponding RNA, of the  
CC nucleotides. The nucleotides are used as probes or primers for detecting,  
CC identifying, quantifying and/or amplifying nucleic acids, as in vitro  
CC sense and antisense sequences, of nucleotides involved in tumour  
CC suppression or reversion, apoptosis and or viral resistance, to produce  
CC recombinant polypeptides, and to prepare transgenic animals, as  
CC experimental models. The nucleotides (also vectors containing them and  
CC cells containing the vectors), the encoded polypeptides and antibodies  
CC (Ab) against the polypeptide are useful for prevention and/or treatment  
CC of viral infections or diseases characterized by development of tumours  
CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).  
CC Analysis of the expression of the nucleotides can be used for diagnosis  
CC and/or prognosis of these diseases. The nucleotides and polypeptides can  
CC also be used to screen for their specific interactive molecules,  
CC potentially useful for treating diseases associated with abnormal  
CC expression of the nucleotides.

XX Amplifying for RNA in a sample, useful for improving RNA polymerase based  
PT RNA transcription from a polynucleotide template, comprises eliminating  
PT single-stranded oligonucleotide from the transcription sample.  
XX Example 1; SEQ ID NO 7; 26pp; English.  
XX The invention relates to amplifying for RNA in a sample comprises

CC eliminating single-stranded oligonucleotide from the transcription  
CC sample. The method involves synthesizing single-stranded cDNA by  
CC incubating the sample RNA with reverse transcriptase and an  
CC oligonucleotide primer that primes synthesis in a direction toward 5' end  
CC of the RNA; converting the single-stranded cDNA into double-stranded cDNA  
CC to form a transcription sample containing a cDNA template; eliminating  
CC single-stranded oligonucleotide from the transcription sample; and  
CC transcribing the cDNA template into RNA using an RNA polymerase. The  
CC method is useful for improving RNA polymerase based RNA transcription  
CC from a polynucleotide template. The method inhibits the undesired non-  
CC template derived production of RNA in the transcription reaction.  
CC Sequences AD134483-AD134489 represent oligonucleotides used in a T7 RNA  
CC transcription reaction.

XX Generating nucleic acid having reduced ability to hybridize for use in  
PT molecular biology, comprises providing nucleotide triphosphates to  
PT synthesize nucleic acid complementary to a template nucleic acid.  
XX Disclosure; SEQ ID NO 16; 74pp; English.  
XX The present invention provides a system for the production of nucleic  
CC acids with reduced levels of intramolecular base pairing (secondary  
CC structure) and intermolecular base pairing by generating unstructured  
CC nucleic acids (UNAs). The invention is useful for generating nucleic acid  
CC having a reduced ability to hybridise. The invention is also useful in  
CC molecular biology and nucleic acid chemistry. The present sequence is an  
CC annealing primer used to generate single-stranded labelled unstructured  
CC nucleic acid (UNA) by polymerase extension reaction (PCR). This sequence  
CC is used in the invention.

CC The invention relates to a class of CpG immunostimulatory
CC oligonucleotides containing a 5'TCG motif or a CG at or the 5' end that
CC are useful for stimulating an immune response. Oligonucleotides and
CC compositions of the invention are useful for treating allergy or asthma,
CC viral and bacterial infections and cancer e.g. biliary tract cancer,
CC breast cancer, cervical cancer, choriocarcinoma, colon cancer,
CC endometrial cancer, gastric cancer, lymphomas, intraepithelial neoplasms,
CC liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma,
CC neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer,
CC rectal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer, brain
CC and CNS cancer, connective tissue cancer, oesophageal cancer, eye cancer,
CC Hodgkin's lymphoma, larynx cancer, oral cavity cancer, skin cancer,
CC testicular cancer, as well as other carcinomas and sarcomas. The
CC invention is also useful in gene therapy. The present sequence is a CpG
CC immunostimulatory oligonucleotide.

XX Determining the nucleotide sequence of a nucleic acid analyte - using
XX electrospray ionisation.
XX
XX Example 1; Fig 3A; 25pp; English.
XX
XX The invention relates to an analytical method for determining the
XX nucleotide sequence of nucleic acid analytes, including chemically
XX modified oligonucleotides. This new method utilises electrospray
XX ionisation-Fourier transform mass spectrometry. The ions are excited by
XX sustained off-resonance excitation with single shot excitation, and the
XX target fragmented by collisionally activated dissociation by a neutral
XX gas, e.g. carbon dioxide. Alternatively, the excitation and dissociation
XX can be nozzle skimmer dissociation. The method is used in molecular
XX biology and biomedical applications. The method, utilising electrospray
XX ionisation-Fourier transform ion cyclotron resonance mass spectrometry,
XX is extremely rapid and acts directly on the oligonucleotide. The method
XX is effective for a variety of nucleic acid analytes, particularly
XX chemically modified oligonucleotides which have not previously been
XX successfully sequenced. The present sequence represents a
XX phosphorothioate oligodeoxynucleotide

XX Providing mRNA profile, by generating two independent patterns  
PT characteristic of sample mRNA population, analyzing patterns, comparing  
PT gene expression by cell types under varied conditions, and identifying  
PT genes.  
XX  
XX Disclosure; Fig 1; 67pp; English.  
XX  
CC The present invention relates to a method for providing a profile of mRNA  
CC molecules present in a sample. The method comprises generating two  
CC independent patterns characteristic of the population of mRNA molecules  
CC expressed in the sample and analyzing the patterns using a combinatorial  
CC algorithm, comparing gene expression by different or same cell types  
CC under different conditions, and identifying genes having a role in  
CC various cellular processes. The method is useful for the analysis and  
CC identification of transcribed genes, and fingerprinting. The method can  
CC be used to identify genes which play a role in determining various  
CC cellular processes, including susceptibility to external factors,  
CC development, and disease. The present sequence for a PCR primer is used  
CC in the production of a single pattern characteristic of a sample,  
CC employing a Type II restriction enzyme (i.e. HaeII) in the methods of the  
CC present invention

XX  
XX Determining polyadenylation sites within transcribed gene sequences  
PT present in a sample comprises assigning to gene fragments gene candidates  
PT within a database by comparing signals in the dataset with the database.  
XX  
XX Example; Fig 2; 81pp; English.  
XX  
XX The invention relates to determining the presence of and/or identifying a  
CC polyadenylation site within a sequence of a transcribed gene or variants  
CC present in a sample. The method involves assigning to gene fragments gene  
CC candidates within a database by comparing signals in the dataset with the  
CC database, the database comprising data representing mRNAs with known

CC polyA sites and/or 'virtual genes' representing a possible  
CC polyadenylation site within an actual gene. The method is useful for  
CC determining the presence of and/or identifying a polyadenylation site or  
CC alternative polyadenylation sites within a sequence of a transcribed gene  
CC or sequences of transcribed gene variants present or potentially present  
CC in a sample, in identifying gene features, particularly in identifying  
CC differences between sequence variants that occur in a population of  
CC nucleic acid molecules, especially in identifying or discovering polyA  
CC site usage or determining polyA site usage in a nucleic acid sample, and  
CC gene variants arising from alternative polyA sites. The present sequence  
XX represents a double stranded product DNA fragment

XX  
XX Producing a population of double-stranded product DNA molecules, useful  
PT for mRNA profiling, comprises amplification by nested polymerase chain  
PT reaction.  
XX  
XX Example; Fig 1; 105pp; English.  
XX  
XX The invention relates to producing a population of double-stranded  
CC product DNA molecules comprising amplification by a nested PCR method.  
CC The method is useful in profiling mRNA transcribed in a system under  
CC investigation. The oligonucleotides are used as size standards in  
CC electrophoresis, and as internal controls allowing for calculation of  
CC relative amounts of material present. The present sequence represents a  
CC double stranded product DNA, which aids in outlining an approach to  
CC production of a single pattern characteristic of a sample, employing a  
CC type II restriction enzyme (HaeII)

 PT Pharmaceutical composition for treating ailments associated with impaired  
 PT respiration, has oligo(s) antisense to specific gene(s) or its  
 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or  
 PT ubiquinone.  
 XX  
 PS Disclosure; SEQ ID NO 5115; 872pp; English.  
 XX  
 CC The invention relates to a novel pharmaceutical composition, which has a  
 CC first active agent comprising an oligonucleotide antisense to the  
 CC initiation codon, coding region, 5' or 3' end genomic flanking regions,  
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of  
 CC junctions of genes encoding a polypeptide associated with lung and/or  
 CC nasal airway dysfunction and a second active agent comprising an

CC antiinflammatory steroid and ubiquinone. A composition of the invention  
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,  
 CC immunosuppressive, and cytostatic activity. The composition may have a  
 CC use in antisense gene therapy. The composition is useful for treating or  
 CC preventing a respiratory, lung or malignant disease or condition, also  
 CC for enhancing the prophylactic or therapeutic respiratory effect of an  
 CC antiinflammatory steroid in a subject, for reducing or depleting levels  
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine  
 CC receptor, producing bronchodilation, increasing levels of ubiquinone or  
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,  
 CC lung inflammation, lung allergies, or a respiratory disease or condition.  
 CC Note: The sequence data for this patent is not represented in the printed  
 CC specification, but was obtained in electronic format directly from WIPO  
 CC at ftp.wipo.int/pub/published\_pct\_sequences

 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.  
 XX  
 PS Claim 15; SEQ ID NO 5115; 763pp; English.  
 XX  
 CC This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,

CC surfactant depletion or hyposecretion, when administered to a mammal. The  
CC oligonucleotides are derived from a gene encoding or regulating  
CC expression of a target polypeptide associated with lung airway or lung  
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
CC The invention also describes a kit, that comprises: (a) a delivery  
CC device, in separate containers, (b) the oligonucleotides, (c)  
CC instructions for adding a carrier and for use of the kit. The composition  
CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
CC beta-adrenergic agonist. The composition is useful for preventing or  
CC treating a respiratory, lung or malignant disease. The administered  
CC composition comprises oligo and is administered to reduce the production  
CC or availability, or to increase the degradation of the target mRNA or to  
CC reduce the amount of target polypeptide present in the lungs. The  
CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
CC inflammation, allergies and/or surfactant hypoproduction are associated  
CC with a disease or condition such as pulmonary vasoconstriction,  
CC inflammation, allergies, asthma, impeded respiration, respiratory  
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
CC The reduced adenosine content of the anti-sense oligos corresponding to  
CC thymidines present in the target RNA serves to prevent the breakdown of  
CC the oligonucleotides into products that free adenosine into the system  
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
CC prevent any unwanted effects due to it

CC targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The
CC human mPGES-1 gene is located on chromosome 9, more specifically to
CC 9q34.3. The present invention also describes: (1) antisense compounds,
CC having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
CC mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
CC inhibits its expression; (2) a method of inhibiting the expression of
CC mPGES-1 in cells or tissues; and (3) a method of treating an animal
CC having a disease or condition associated with mPGES-1. mPGES-1 chimeric
CC antisense oligonucleotides and antisense compounds have cytostatic,
CC antidiabetic, immunomodulator, cardiant, neuroprotective,
CC antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,
CC ophthalmological, immunomodulatory and cardiovascular activities, and can
CC be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
CC can be used for preparing a composition for treating a disease or
CC condition associated with mPGES-1 e.g., inflammation, Alzheimer's
CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
CC ophthalmic, immunological, cardiovascular or neurological disorder.

PT Antisense oligonucleotide(s) complementary to hepatitis C viral genome  
 PT - useful for inhibiting HCV replication, to treat related diseases.  
 XX Example 7; Page 24; 91pp; English.  
 XX Antisense oligonucleotides were synthesised which are complementary to  
 CC target sequences located at 10-nucleotide intervals from nucleotide 1 to  
 CC 339 in the HCV RNA 5'-untranslated region. Of these sequences (CAS-1 to  
 CC CAS-320), oligonucleotide CAS-110 (AAQ58403), which is complementary to a  
 CC portion of loop C, was found to cause greater than 80% inhibition of core  
 CC protein translation. The nucleotide at position 119 in loop C has a high  
 CC variation rate among HCV strains so oligonucleotide CAS-110-1-119 was  
 CC synthesised in which inosine replaced the T (corresp. to A at position  
 CC 119) in CAS-110. The CAS-110-1-119 showed an inhibitory activity of more  
 CC than 70%. A control oligonucleotide (CAS-110-G-119) showed much lower  
 CC activity. See AAQ58388-Q58422, AAQ44885-Q44892 and AAQ58383. (Updated on  
 CC 25-MAR-2003 to correct PN field.)

 DR Efficient sequencing of long DNA by fragment walking - with simultaneous  
 PT sequencing of restriction enzyme fragment and adjacent region of intact  
 PT DNA, avoids the need for cloning and requires fewer primers.  
 XX Example 1; Page 11; 50pp; English.  
 PS A method for DNA analysis based on a complementary extension reaction  
 CC using a DNA polymerase, comprises a combination of fragment walking and  
 CC DNA sequencing. DNA fragments are formed by digestion of DNA with a  
 CC restriction enzyme and the targeted DNA sequence can be determined  
 CC directly from the digested DNA fragments. By exploring the overlapping  
 CC sequence of the determined base sequence, the overall base sequence of a  
 CC lengthy DNA can be determined with low redundancy without cloning or  
 CC subcloning. In addition, the method can be done with commercially

CC available universal primers or with fewer primers than required in  
CC existing methods. AAT73291-92 are primers used in determination of the  
CC pUC19 sequence. Primer extension was carried out using 16 primers

PT New oligo-nucleotide(s) complementary to untranslated regions of  
PT housekeeping genes - are useful in, e.g. identifying modulators of tumour  
PT growth/metastasis and inhibiting growth of neoplastic cells.  
XX  
PS Claim 4; Page 29; 64pp; English.  
XX  
CC The present sequence represents a 3'-untranslated region (3'UTR) fragment  
CC of ribonucleotide reductase R1. The present invention describes: (1)  
CC oligonucleotides (ON) comprising at least 7 consecutive nucleotides (nt)  
CC or their analogues of a UTR of a housekeeping gene; (2) antisense ON  
CC (AON) complementary to ON; (3) ribozymes (Rb) complementary or homologous  
CC to ON, and able to cleave it; (4) DNA sequence encoding ON, AON and Rb;  
CC (5) an antibody (Ab) that binds to ON, AON and Rb; (6) a nt probe ntp  
CC that hybridise to ON, AON and Rb. ON, AON, Rb and Ab are used to modulate  
CC (especially inhibit) growth of tumour cells (especially neoplastic cells)  
CC and to reduce their capacity for metastasis. The above may also be used  
CC to treat benign proliferative disorders e.g. papillomas, atherosclerosis,  
CC angiogenesis and viral infections e.g. human immunodeficiency virus,  
CC hepatitis or herpes. ON may further be used: (i) to identify modulators  
CC of tumour growth/metastasis; (ii) to identify compounds (especially  
CC potential antitumour agents) that inhibit or enhance interaction between  
CC ON and its binding substances; (iii) as probes for detecting related  
CC sequences, and (iv) to generate Ab, used for cancer therapy and quantification  
CC of UTR especially for monitoring progress of cancer therapy. SON inhibit  
CC tumorigenicity of neoplastic cells, particularly where these are  
CC resistant to hydroxyurea

PT Antisense oligonucleotides to ribonucleotide reductase genes - used to  
PT modulate tumour growth and inhibit tumour cell proliferation.  
XX  
PS Claim 8; Page 49; 79pp; English.  
XX  
CC AAV22531-89 represent antisense oligonucleotides which are targeted  
CC against the mRNA of the R1 subunit sequence of ribonucleotide reductase.  
CC Aberrant expression of the R2 gene, which encodes the second subunit of  
CC the ribonucleotide reductase gene, can determine the malignant  
CC characteristics of cells. Suppression of R2 and R1 gene expression was  
CC found to reduce transformed properties of tumour cells. The antisense  
CC oligonucleotides can be used for modulating tumour cell growth, or for  
CC inhibiting tumour cell proliferation. They can also be used for  
CC increasing the sensitivity of neoplastic cells to chemotherapeutic drugs  
CC (especially to hydroxyurea, methotrexate (MTX), and PALA). The antisense  
CC oligonucleotides may be used to treat proliferative disorders including  
CC cancer, papillomas, atherosclerosis, psoriasis, polythemia, mastocytosis,  
CC leukemias, lymphomas, sarcomas, melanomas, various other forms of  
CC cancer, papillomas, atherosclerosis, psoriasis, polythemia, mastocytosis,  
CC autoimmune diseases, angiogenesis, bacterial infections and viral  
CC infections (including HIV hepatitis, or herpes infections)

XX
XX New antisense oligonucleotide, AS-I-618-20, is useful for inhibiting
PT tumor cell growth.
XX
XX Example 3; Page 32; 137pp; English.
XX
XX The present sequence is an antisense oligonucleotide directed against the
CC mRNA encoding the R1 component of mammalian ribonucleotide reductase.
CC Ribonucleotide reductase catalyses the conversion of ribonucleotides to
CC their corresponding deoxyribonucleotides and thus plays an important role
CC in DNA synthesis and cell proliferation. Regulation of ribonucleotide
CC reductase is altered in cultured malignant cells and increased levels of
CC R2 protein and R2 mRNA have been found in pre-malignant and malignant
CC tissues as compared to normal control tissue samples. The present
CC antisense sequence is therefore useful for inhibiting tumorigenicity of
CC neoplastic cells and inhibiting metastasis of tumour cells. It is also
CC useful for increasing sensitivity of neoplastic cells to chemotherapeutic
CC drugs, thus allowing chemotherapeutic treatments to be used in patients
CC who have become resistant or less sensitive to chemotherapy. The sequence
CC may be RNA or DNA and may comprise a modified backbone and/or nucleotide
CC analogues

XX
XX Analyzing target nucleic acid sequences, useful for population genetics,
PT drug development and diagnosing cancer, comprises hybridizing triple
PT forming oligonucleotide and probe to target sequence.
XX
XX Example 2; Page 66; 141pp; English.
XX
XX The sequence is a polypyrimidine oligonucleotide for binding a second
CC reverse phase triplex forming oligonucleotide, RP-TFO, (3' to the SNP) to
CC the target SNP used to analyse Factor V Leiden SNP using the method of
CC the invention. The invention relates to analysing target nucleic acid
CC sequences comprising restricting isolated DNA, hybridising at least one
CC triplex forming oligonucleotide (TFO), adding a 3' to 5' exonuclease to
CC form a protected nucleic acid sequence (PNAS) tail structure, hybridising
CC the captured structure with a single nucleotide polymorphisms (SNP)
CC identification probe and determining the SNP score. The methods can be
CC used for analysing target nucleic acid sequences, especially genomic DNA
CC sequences, to determine if they contain SNPs or short tandem repeats
CC (STRs). The methods can be used to detect SNPs for use in population
CC genetics, drug development, forensics, cancer, genetic disease research,
CC genomic analysis, diagnostics and therapeutics in humans, plants and
CC animals

 PT A western equine encephalitis (WEE) virus strain used to develop DNA  
 PT vaccines to WEE virus and related alphaviruses.  
 XX  
 PS Disclosure; Page 28; 52pp; English.

XX The invention relates to a novel mammalian expression vector, under which  
 CC expression of the structural genes of western equine encephalitis (WEE)  
 CC virus strain 71V-1658 have been placed under the control of a eukaryotic  
 CC promoter. The expression vector has anti-encephalitis activity. The  
 CC invention provides a means of developing a vaccine to the WEE virus which  
 CC is important for protection against an aerosol challenge of WEE used in  
 CC biological warfare. The prophylactic method of the invention is used for  
 CC inducing a protective immune response to eastern equine encephalitis  
 CC virus and Venezuelan equine encephalitis virus in a mammal. The present  
 CC sequence represents a WEE virus 26S region PCR primer.

CC bronchoconstriction, respiratory tract inflammation, allergies and CC  
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptor CC  
CC surfactant depletion or hyposecretion, when administered to a mammal. CC  
CC oligonucleotides are derived from a gene encoding or regulating CC  
CC expression of a target polypeptide associated with lung airway or lung CC  
CC

PT nucleic acids associated with lung airway or lung dysfunction, and  
 XX bronchodilating agent.  
 PS Claim 15; SEQ ID NO 777; 763pp; English.  
 XX  
 CC This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

Geldermann H, Preuss S, Han Y;  
 WPI; 2004-215730/21.

Typing genes that contain polymorphic microsatellite loci, useful for  
 identifying predisposition to disease, by amplification and determining  
 length of amplicons.

Example 3; Page 28; 64pp; German.

The invention describes a method of typing (M1) a gene (I) that has one  
 or more polymorphic microsatellite loci (PMU). The method comprises: PCR  
 amplification of at least one DNA region of (I) that includes PMU, using

CC as template a DNA sample containing at least one segment of (I); and  
CC determining the length of the resulting amplicon(s). Also described are:  
CC a method of determining (M2) microsatellite markers (MM) for  
CC predisposition to a disease, associated with a gene that includes one or  
CC more PML; and prediagnosis (M3) of diseases associated with gene that  
CC include PML. The method is used to identify microsatellite markers, in a  
CC disease-related gene, that are associated with a predisposition to  
CC diseases and for prediagnosis of such diseases, especially prion diseases  
CC but also cystic fibrosis, malignant hyperthermia syndrome in pigs and  
CC metabolic diseases; also to type genes that encode milk proteins,  
CC hormones or transcription factors. The method is simpler, quicker and  
CC particularly less expensive than known methods based on sequencing. This  
CC sequence represents a primer used to genotype a region of the cow prion  
CC protein (PrP) comprising a polymorphic microsatellite locus.

PT mitONEET expression or for treating diseases associated with mitONEET,  
PT e.g. diabetes, immunological disorders or cardiovascular disorders.

XX PS Claim 4; SEQ ID NO 199; 226pp; English.

XX CC The invention comprises antisense oligonucleotides that are targeted to  
CC the nucleic acids encoding a family of human proteins from mitochondrial  
CC membranes, which bind insulin sensitising, antidiabetic  
CC thiazolidinediones (referred to as: mitONEET). The antisense  
CC oligonucleotides of the invention are useful for modulating mitONEET  
CC expression and for treating diseases or conditions associated with  
CC mitONEET, such as: diabetes, immunological disorders, cardiovascular  
CC disorders including hypertension, neurological disorders, and  
CC ischaemia/reperfusion injuries. The present DNA sequence represents a

CC mitONEET-specific antisense oligonucleotide of the invention. NOTE: The  
CC present sequence is a 2'-methoxyethyl (2'-MOE) gapmer with a  
CC phosphorothioate backbone.

XX PT Novel isolated nucleic acid encoding a promoter which is capable of  
PT driving chemically inducible but not wound- or pathogen-inducible  
PT expression of an associated nucleotide sequence.

XX PS Example 3; Page 30; 88pp; English.

XX CC The invention relates to an isolated nucleic acid molecule (a promoter of  
CC rice chemically induced cDNA (RCI-1), which encodes a lipoxigenase)  
CC capable of driving chemically-inducible but not wound- or pathogen-  
CC inducible expression of an associated nucleotide sequence. Also included  
CC are the RCI-1 cDNA, its encoded protein, a 4.5kb genomic clone for the  
CC lipoxigenase gene, promoter fragments, the lipoxigenase transit peptide  
CC which directs expressed proteins to the plastid, a vector comprising the  
CC promoter or fragments and a transgenic plant comprising the vector. The  
CC promoter or fragments are useful for expressing a nucleotide sequence of  
CC interest. The transit peptide is useful for targeting an associated  
CC protein of interest to plastids. A nucleic acid which expresses  
CC polypeptide having lipoxigenase activity is useful for inhibiting fungal  
CC mycotoxins when transformed into a plant. The lipoxigenase is useful for  
CC inhibiting fungal mycotoxins. The promoter is useful for regulating  
CC transcription of a chemically inducible but not wound or pathogen  
CC inducible gene, which involves applying a chemical regulator to a plant  
CC or seed containing a chemically regulatable nucleotide sequence.  
CC Transgenic plants as described above are useful for breeding improved  
CC plant lines that for example increase the effectiveness of conventional  
CC methods such as herbicide or pesticide treatment or allow to dispense

CC with the methods due to their modified genetic properties. New crops with  
CC improved stress tolerance can be obtained that, due to their optimised  
CC genetic equipment yield harvested product of better quality than products  
CC that were not able to tolerate comparable adverse developmental  
CC conditions. The present sequence is an anchored oligo-dt reverse RT-PCR  
CC primer (reverse transcriptase PCR) used to isolate the cDNA encoding rice  
CC lipoxigenase

XX DNA fragment coding for Papillomavirus antigenic proteins - and derived  
XX immunogen, vaccine and antibody.  
XX Claim 6; Page 16; 25pp; French.

XX The inventors claim DNA fragments capable of expressing, in a host, a  
XX prod. contg. at least one antigenic determinant of papillomavirus (PV),  
XX (see AAN30170-N30173). Also claimed are immunogens consisting of at least  
XX one peptide sequence coded for by the DNA fragments (see AAP30310-  
XX P30313). vaccines contg. the immunogens and antibodies raised from them.  
XX The vaccines are useful in human and veterinary medicine and the  
XX antibodies are useful as diagnostic reagents. The DNA fragments are most  
XX esp. derived from the L1 region of human PV type 1a

 XX  
 PS Claim 11; Page 64; 77pp; English.  
 XX  
 CC The sequence depicts a HUMNFR (tumour necrosis factor receptor) mRNA  
 CC sequence beginning at nucleotide 2354. The sequence is a viral duplex  
 CC duplex contg. a purine-rich region concentrated on one chain of the  
 CC duplex. The sequence may be prepd. by standard DNA synthesis. The HUMNFR  
 CC duplex sequence is used as a target for novel oligomers which are capable  
 CC of forming a triplex at physiological pH by coupling into the major  
 CC groove of the DNA duplex. Three such oligomers TNFR 941-32 are capable of  
 CC forming a triplex with this sequence. The oligomers are used in the  
 CC treatment of inflammation. Similar oligomers may be used to target viral  
 CC DNA duplexes specific for HIV, herpes and other viruses. The triple  
 CC helices form under mild conditions thus assays may be carried out without  
 CC subjecting the test specimen to harsh conditions. The oligomer is able to  
 CC inhibit gene expression, as verified by in vitro systems. See also  
 CC AAQ25452-25500 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN  
 CC field.)

 XX This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences

 XX Producing binary sequence tags, useful for analyzing nucleic acid sequence tags, gene expression or gene-expression patterns, involves generating nucleic acid fragments, which are mixed with offset adaptors and adaptor-indexers.  
 XX Disclosure; Page 100; 101pp; English.  
 XX The present invention describes a method of producing binary sequence tags from nucleic acid fragments in a sample, involving incubating the sample with cleaving reagents, mixing offset adaptors with the sample, incubating with more cleaving reagents and mixing the sample with adaptor -indexers where the adaptors are coupled to binary sequence tags. The method is useful in sequence analysis, including analysis and comparison of gene expression, nucleic acid samples and genomes

XX New short interfering nucleic acid, useful e.g. for treatment and

PT diagnosis of cancer, downregulates expression of mitogen-activated

PT protein kinase genes.

XX Example 3; SEQ ID NO 163; 164pp; English.

XX The present invention describes a short interfering nucleic acid (siNA)

CC that downregulates expression of a mitogen-activated protein kinase

CC (MAPK) genes by RNA interference. Also described: (1) a method for

CC modulating expression of MAPK genes in cells, tissue explants or

CC organisms by introduction of siNA; (2) kits for in vitro or in vivo

CC delivery of siNA; (3) conjugates and/or complexes of siNA; and (4)

CC vectors that express siNA and cells containing these vectors. MAPK siNAs

CC have cytostatic, anorectic, antidiabetic, antibacterial, antirheumatic,

CC antiarthritic, immunosuppressive, antidiabetic, antidiabetic, antidiabetic,

CC antiarthritic, antipsoriatic and gastrointestinal activities. The MAPK

CC siNAs can be used to modulate the expression of MAPK genes, in cells,

CC tissue explants or organisms, e.g. for treating obesity; diabetes types I

CC and II; a wide range of tumours, and inflammatory diseases (asthma,

CC septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel

CC disease). They can also be used for drug screening; diagnosis; target

CC identification and validation; genetic engineering; pharmacogenomics;

CC studying gene function and gene mapping (e.g. of single-nucleotide

CC polymorphisms). The present sequence represents a MAPK siNA which is used

CC in the exemplification of the present invention.

XX
XX Efficient sequencing of long DNA by fragment walking - with simultaneous
PT sequencing of restriction enzyme fragment and adjacent region of intact
PT DNA, avoids the need for cloning and requires fewer primers.
XX
XX Example 1; Page 11; 50pp; English.
XX
XX A method for DNA analysis based on a complementary extension reaction
CC using a DNA polymerase, comprises a combination of fragment walking and
CC DNA sequencing. DNA fragments are formed by digestion of DNA with a
CC restriction enzyme and the targeted DNA sequence can be determined
CC directly from the digested DNA fragments. By exploring the overlapping
CC sequence of the determined base sequence, the overall base sequence of a
CC lengthy DNA can be determined with low redundancy without cloning or
CC subcloning. In addition, the method can be done with commercially
CC available universal primers or with fewer primers than required in
CC existing methods. AA73291-92 are primers used in determination of the
CC pUC19 sequence. Primer extension was carried out using 16 primers

 CC The present sequence is an oligonucleotide provided in a specification  
 CC relating to the simplified purification of oligonucleotides by liquid  
 CC chromatography. The process comprises: (a) pouring oligonucleotides  
 CC protected with a hydrophobic group and oligonucleotide with no protective  
 CC group into a liquid chromatography column packed with an acid and alkali  
 CC resistant packing agent, such as polystyrene resin; (b) pouring a mixed  
 CC developing solvent composed of a buffer made from a volatile salt and a  
 CC water soluble organic solvent at a suitable concentration gradient into  
 CC the column; (c) pouring an acid, particularly 6-16 v/v% acetic acid, into  
 CC the column to deprotect the oligonucleotides protected with the  
 CC hydrophobic group; (d) pouring a mixed developing solvent composed of a  
 CC buffer made from a volatile salt, particularly 0.05-0.5 N aqueous  
 CC ammonium hydrogencarbonate solution adjusted at pH 8-10, and a water  
 CC soluble organic solvent at a suitable concentration gradient to elute the  
 CC deprotected oligonucleotides; and (e) removal of the solvent and the salt  
 CC from the eluted oligonucleotides

 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposcretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

XX DR New immunostimulatory nucleic acid molecule having pyrimidine-purine
XX DT dinucleotide and a chimeric backbone, useful in treating and preventing
XX PT asthma, allergy, cancer, infectious disease, autoimmune disease or airway
XX PT remodeling.
XX CC Example 28; SEQ ID NO 376; 276pp; English.
XX CC The invention relates to an immunostimulatory nucleic acid molecule
XX CC comprising an internal pyrimidine-purine (YZ) dinucleotide and chimeric
XX CC backbone, where one internal YZ dinucleotide has a phosphodiester(-like)
XX CC internucleotide linkage, where optionally each additional internal YZ
XX CC dinucleotide has a phosphodiester(-like) or stabilised internucleotide
XX CC linkage, where other internucleotide linkages are stabilised. The
XX CC oligonucleotide is useful in stimulating or modulating an immune
XX CC response. The medicament shifts the immune response to a Th1 biased
XX CC in the manufacture of a medicament for treating asthma, allergy, cancer,
XX CC infectious disease, autoimmune disease, airway remodeling or chronic
XX CC obstructive pulmonary disease or in treating a subject who is a smoker or
XX CC who is free of symptoms of asthma. The oligonucleotide is useful in
XX CC inducing cytokine expression, e.g. IL-6 (interleukin-6), TNFalpha (tumour
XX CC necrosis factor alpha), IFNalpha (interferon-alpha), IFNgamma (interferon
XX CC -gamma) and IP-10 (interferon inducible protein). The oligonucleotide is
XX CC also useful in treating and preventing infections caused by viruses,
XX CC bacteria and parasites. The present sequence represents an
XX CC immunostimulatory nucleic acid.

CC This sequence represents a primer of the invention. The invention relates
CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC natural number indicating the repetition of alpha; beta, delta = V or N;
CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC repetition of gamma, in which thymine expressed by gamma is composed of
CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC useful as primers for RT-PCR and determination of base sequences. The new
CC sequences allow for reproductive and highly efficient analysis of gene

 XX PT New nucleoside derivatives with photolabile protecting groups, useful in  
 XX PT oligonucleotide synthesis, particularly on solid phases, e.g. for  
 XX PT hybridization testing.  
 XX PS Disclosure; Fig 9; 48pp; German.  
 XX CC This invention describes nucleoside derivatives (I) with photolabile  
 XX CC protecting groups. (I) are used to synthesize oligonucleotides using the  
 XX CC photolithographic nucleic acid chip method, particularly where these are  
 XX CC intended for performing enzymatic reactions initiated from a free 3'-  
 XX CC hydroxy (especially solid-phase polymerase reactions or ligase reactions,  
 XX CC but also reverse transcription, cDNA synthesis etc.), also for  
 XX CC hybridization testing, sequencing and in DNA computing. (I) are produced  
 XX CC with high selectivity by reaction with a mild acylating agent that has  
 XX CC high specificity for the 3'-position, without significant side-reactions  
 XX CC (cf. more reactive acylating agents such as chloroformates)

XX XX
XX CC The present sequence is that of an oligonucleotide (ODN)-minor groove
XX CC binder (MGB) complex. MGBs bind in a non-intercalating manner to the
XX CC minor groove of non-single-stranded DNA, RNA or their hybrids. ODN-MGB-LF
XX CC conjugates of the invention also comprise a latent fluorophore (LF),
XX CC which binds similarly to the MGB but in an intercalating manner, or lies
XX CC in the minor groove, or is oriented in some other way to the DNA molecule
XX CC by MGB, such that it becomes fluorescent (or its fluorescent properties
XX CC change detectably). The conjugates are used as hybridisation probes and
XX CC amplification primers for fluorescent detection of specifically
XX CC hybridising sequences, for analysis or diagnosis, especially (real-time)
XX CC PCR, for single-nucleotide mismatch discrimination, target or signal
XX CC amplification, array-based assays and sequencing, including detection of
XX CC double-stranded DNA by triplex formation

PS Disclosure; Page 58; 105pp; English.

XX  
 CC The present sequence is that of the oligonucleotide (ODN) component of an  
 CC ODN-MGB (minor groove binder)-LF (latent fluorophore) conjugate of the  
 CC invention. MGBs bind in a non-intercalating manner to the minor groove of  
 CC non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly  
 CC but in an intercalating manner, or lies in the minor groove, or is  
 CC oriented in some other way to the DNA molecule by MGB, such that it  
 CC becomes fluorescent for its fluorescent properties change detectably).  
 CC The conjugates are used as hybridisation probes and amplification primers  
 CC for fluorescent detection of specifically hybridising sequences, for  
 CC analysis or diagnosis, especially (real-time) PCR, for single-nucleotide  
 CC mismatch discrimination, target or signal amplification, array-based  
 CC assays and sequencing, including detection of double-stranded DNA by  
 CC triplex formation. Many different targets can be detected a single  
 CC reaction vessel. The present ODN-MGB-LF conjugate was used to demonstrate  
 CC hybridisation-triggered fluorescence. Upon hybridisation to the  
 CC complementary target sequence there was an increase in fluorescence  
 CC yield, measured as the ratio of the fluorescence emitted by the hybrid  
 CC between the ODN-MGB-LF conjugate and its target sequence to the  
 CC fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF,  
 CC of 8.3

XX Dubertret B, Calame M, Libchaber A;

XX WPI; 2002-404569/43.

XX The present sequence is that of a perfectly matched target sequence for a  
CC molecular beacon comprising an oligonucleotide probe (see AB57069)  
CC covalently attached at the 3' end to fluorescent dye and at the 5' end to  
CC a nanoparticle. In the native state, the probe forms a hairpin  
CC conformation with hybridised termini. The proximity of the fluorophore  
CC and quencher (gold nanoparticle) in the molecular beacon results in  
CC little or no detectable fluorescence. Upon hybridisation of the central  
CC complementary stretch of the probe to a target sequence, such as the  
CC present sequence, the hairpin undergoes a conformational change resulting  
CC in an increase in fluorescence, the extent of which is proportional to  
CC the amount of target sequence present. Single mismatches can be detected.  
CC The invention relates generally to the use of metal surface quenchers  
CC such as particles or films for high sensitivity applications in, for  
CC example, detection and diagnostic systems

PT Oligonucleotides analogs useful in detection, separation and purification  
PT of nucleic acid molecules, comprise monomers, dimers and oligomers.  
XX  
PS Example 17; Page 118; 197pp; English.  
XX  
CC This invention relates to oligonucleotide analogues comprising a protein  
CC nucleic acid molecule (PNA) monomer. They are used in the detection and  
CC separation of nucleic acid molecules and as probes, primers, linkers,  
CC adapters and antisense agents on solid supports. Modifications enhance  
CC their use as capture and detection probes e.g. by the incorporation of  
CC biotin, digoxigenin, radioisotopes, fluorescent labels such as  
CC fluorescein and reporter molecules such as alkaline phosphatase. They are  
CC also used for enhancing or inhibiting the activity of an enzyme or  
CC cellular activity. The compounds are stable to nucleases and proteases,  
CC have high affinity, binding specificity and solubility. The polyamide  
CC backbone of PNAs is resistant to both nucleases and proteases. PNAs bind

CC nucleic acid molecules with greater affinity than DNA or RNA  
CC concentration. The compounds are relatively simple to synthesize and are  
CC used in a wide variety of applications. This sequence represents a DNA  
CC oligomer which is used to represent the thermal stability of the  
CC oligomers of the invention

PT Novel acyclic linker-containing oligonucleotide useful for preventing or  
PT decreasing translation, reverse transcription and/or replication of a  
PT target RNA in a system, comprises a modified deoxyribonucleotide.  
XX  
PS Example 2; Fig 7; 104pp; English.  
XX  
CC The invention relates to an acyclic linker-containing oligonucleotide  
CC comprising at least one modified deoxyribonucleotide. Oligonucleotides of  
CC the invention are useful for preventing or decreasing translation,  
CC reverse transcription and/or replication of a target RNA in a system.  
CC They are useful for selectively preventing gene expression in a sequence-  
CC specific manner, for hybridising to complementary RNA such as cellular  
CC mRNA or viral RNA, to hybridise to and induce cleavage of complementary  
CC RNA. They are also useful therapeutically in formulations or medicaments  
CC to prevent or treat a disease characterised by the expression of a  
CC particular target RNA. The invention is used in gene therapy. The present

CC sequence is an antisense oligo used to elicit human RNase (ribonuclease)  
CC H degradation of target RNA. This sequence is used in the exemplification  
CC of the invention

PT Detecting polynucleotides, for pharmacogenetic testing, comprises  
PT contacting a target polynucleotide with a complementary single-stranded  
PT sensor polynucleotide and an agent that allows the sensor to fluoresce  
PT upon excitation.  
XX  
PS Example 1; Page 25; 41pp; English.  
XX  
CC The invention relates to a novel assay for detecting a polynucleotide in  
CC a sample, which comprises: contacting a sample suspected of containing a  
CC target polynucleotide with a predetermined single-stranded sensor  
CC polynucleotide complementary to the target polynucleotide, in a solution  
CC comprising an agent that is a nonaqueous solvent that allows the sensor  
CC polynucleotide to produce a detectable fluorescence emission; exciting  
CC the sensor polynucleotide, and determining fluorescence emission. The  
CC assay is useful for detecting a single or double-stranded target  
CC polynucleotide, such as, DNA or RNA in a sample. The assay finds use in a  
CC wide variety of different applications including pharmacogenetic testing,  
CC forensic testing to identify the species or individual which was the  
CC source of a forensic specimen, in anthropological setting, paternity  
CC testing, testing for compatibility between prospective tissue or blood  
CC donors and patients and in screening for hereditary disorders. The method  
CC is also useful to study alterations of gene expression in response to a  
CC stimulus, disease, drug or medication, and other applications include  
CC human population genetics, analyses of human evolutionary history and  
CC characterisation of human haplotype diversity. The method is useful for  
CC detecting polynucleotide sequences from contaminants or pathogens

CC including bacteria, yeast, and viruses to detect single nucleotide  
CC polymorphisms, which may be associated with particular alleles or subsets  
CC of alleles. The method is useful for detection of mutations and to detect  
CC nucleotide sequences associated with increased risk of diseases or  
CC disorders including cystic fibrosis, Tay-Sachs, and sickle-cell anaemia.  
CC This polynucleotide sequence represents an oligonucleotide sequence used  
CC in a fluorescence technique of the invention

XX Method of inhibiting expression of genes or RNA transcripts, useful for
PT therapy and determining effects of genes, by administering oligomers
PT containing hydroxyproline nucleic acid.
XX
XX Example 17; Page 233; 240pp; English.
XX
XX The invention relates to a novel method of inhibiting the expression of
CC one or more genes or RNA transcripts by administering at least one
CC oligonucleotide analogue that includes at least one hydroxyproline
CC nucleic acid (HypNA) monomer to a cell or organism or their extracts. Thr
CC oligonucleotides of the invention may be used to monitor properties
CC including gene expression, respiration, secretion, signalling, ion-
CC channel activity, cell motility, developmental phenotype and tumour
CC regression. Furthermore, they may be utilised to determine the effects of
CC particular genes, as antisense or homologous recombination constructs
CC e.g. for creating animal models of disease and finally, for increasing
CC the activity of some enzymes, such as polymerases. The current sequence
CC is that of the DNA hybridisation oligomer SEQ ID 9 of the invention. This
CC sequence may also comprise a peptide nucleic acid (PNA).

XX
XX Screening of candidate binding partners for binding to test molecule
PT comprises illuminating sample with light beams and measuring physical
PT properties of nonlinear optical light beam emanating from sample.
XX
XX Disclosure; SEQ ID NO 2; 58pp; English.
XX
XX The invention describes screening a candidate binding partner by
CC illuminating the sample with light beams at fundamental frequencies to
CC binding partners, and measuring physical properties of a nonlinear
CC optical light beam emanating from sample. On binding to the test molecule
CC the properties change relative to that in absence of exposure of the test
CC molecule. The invention is used in the screening of candidate binding
CC partners for binding to test molecule. This sequence represents a
CC molecular beacon analogue, an exemplary test molecule of the invention.

XX Amplifying for RNA in a sample, useful for improving RNA polymerase based
XX RNA transcription from a polynucleotide template, comprises eliminating
XX single-stranded oligonucleotide from the transcription sample.
XX
XX Example 1; SEQ ID NO 6; 26pp; English.
XX
XX The invention relates to amplifying for RNA in a sample comprises
XX eliminating single-stranded oligonucleotide from the transcription
XX sample. The method involves synthesizing single-stranded cDNA by
XX incubating the sample RNA with reverse transcriptase and cDNA by
XX oligonucleotide primer that primes synthesis in a direction toward 5' end
XX of the RNA; converting the single-stranded cDNA into double-stranded cDNA
XX to form a transcription sample containing a cDNA template; eliminating
XX single-stranded oligonucleotide from the transcription sample; and
XX transcribing the cDNA template into RNA using an RNA polymerase. The
XX method is useful for improving RNA polymerase based RNA transcription
XX from a polynucleotide template. The method inhibits the undesired non-
XX template derived production of RNA in the transcription reaction.

PT Assay of genetic sequences based on triplex formation from double
PT stranded analyte - and hybrid of anchor and reporter sequences, with
PT reporter released if triplex formation occurs, used e.g. to identify
PT bacteria.
XX
PS Disclosure; Col 15-16; 168pp; English.
XX
CC The present sequence represents a potential triple-helix forming region.
CC It can be used to demonstrate the assay of the invention. The assay
CC comprises adding a sample containing double-stranded DNA test sequences,
CC e.g. containing the present sequence, to an aqueous medium containing at
CC least one complex of anchor DNA, attached to a solid support, and
CC reporter DNA, where either a part of the anchor DNA or reporter DNA is
CC designed to form a triple-strand structure with part of the test
CC sequence. Triplex formation results in displacement of the reporter DNA
CC which is detected as an indication of the presence of the DNA test
CC sequence. The method is used to detect DNA sequences, particularly for
CC identification of bacteria (by detecting genes for ribosomal RNA) in
CC clinical samples, but also detection of oncogenes and Hepatitis B virus

 XX Gene highly expressed in patients with high cedar pollen-specific IgE  
 XX levels, useful for diagnosing pollenosis, and screening candidate  
 XX compounds for pollenosis treatment.  
 XX  
 XX Example 6; Page 38; 44pp; Japanese.  
 XX  
 XX This sequence represents a PCR primer used in the identification of a  
 XX human pollenosis associated gene. The gene is highly expressed in  
 XX individuals with high pollen-specific immunoglobulin E (IgE) levels. The  
 XX invention relates to the nucleotide sequence encoding the pollenosis  
 XX associated protein, diagnosing pollenosis and screening candidate  
 XX compounds for treating pollenosis. The gene can be used in diagnosing  
 XX pollenosis, particularly cedar pollenosis, and screening candidate  
 XX compounds for pollenosis treatment

 XX PT proteins encoded by them, and antibodies to those proteins.  
 XX

PS Claim 3; Page 170; 180pp; Japanese.  
 XX  
 XX This invention describes novel DNA sequences preferentially expressed in  
 XX IgA nephropathy patients, and DNA sequences stringently hybridizing to  
 XX them. Independent claims cover diagnostic reagents for IgA nephropathy  
 XX incorporating the antisense sequences; the treatment of IgA nephropathy  
 XX using the antisense sequences for mRNA inhibition; proteins associated  
 XX with IgA nephropathy, containing sequences encoded by the DNA sequences;  
 XX antibodies recognizing these proteins; the production of the proteins by  
 XX culture of host cells transformed with DNA encoding them; diagnostic  
 XX reagents for IgA nephropathy containing the antibodies; and compositions  
 XX for the treatment of IgA nephropathy which contain the antibodies. The  
 XX products of the invention can be used for the diagnosis and treatment of  
 XX IgA nephropathy. This sequence represents a primer used in the isolation  
 XX and identification of the human IgA nephropathy-associated proteins  
 XX described in the method of the invention

PT subjects with high cedar pollen-specific IgE levels, useful in diagnosis
PT of allergic diseases and screening drug candidates.
XX
PS Example 6; Page 42; 51pp; Japanese.
XX
CC The invention relates to the human pollinosis-associated gene 627 which
CC exhibits significantly reduced expression in the T-cells of individuals
CC with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene
CC was isolated from T-cells from individuals allergic to cedar pollen using
CC the differential display method. The invention also relates to methods of
CC the differential display method. The invention also relates to methods of
CC detection of pollinosis-associated gene 627 nucleic acids; a method of
CC diagnosis of allergic diseases via the detection of pollinosis-associated
CC gene 627 nucleic acids; and a method of screening drug candidates for the
CC treatment of allergic disease by measuring the expression of pollinosis-
CC associated gene 627 in pollen antigen-stimulated T-cells in the presence
CC of a test compound relative to a control. Pollinosis-associated gene 627
CC is useful in the diagnosis of allergic diseases and in the screening of
CC drug candidates for the treatment of such diseases. The present sequence
CC represents a PCR primer used in the isolation of human pollinosis-
CC associated gene 627 cDNA

 CC Examining allergic diseases by differential display of gene showing  
 CC different expression particularly increased expression in remission stage  
 CC in eosinophils of patients, also applicable in screening candidate  
 CC compounds for remedies.  
 XX  
 PS Example 1; Page 56; 72pp; Japanese.  
 CC  
 CC The invention relates to a method for examining allergic diseases  
 CC comprising determining the expression level of a gene containing, the  
 CC human cDNA appearing as ABK49635 which has homology with  
 CC acetyltransferases in the eosinophils of a patient and comparing the  
 CC expression level with that in the eosinophils of a healthy individual  
 CC (i.e. differential display). Also included are methods of screening for  
 CC candidate compounds which affect the expression level of the gene or the  
 CC activity of the protein encoded by the gene (including related proteins  
 CC and mutants), the use of probes based on the gene sequence in the  
 CC examination of allergic diseases, the use of reporter constructs in the  
 CC screening of candidate compounds, a vector containing a the transcription  
 CC -controlling region of the gene, cells transformed with the vector, an  
 CC antibody against the protein and a model animal for allergic diseases  
 CC which is a transgenic non-human vertebrate with lowering of expression  
 CC intensity of the gene in eosinophils. The method is examining allergic  
 CC diseases particularly atopic dermatitis which is also applicable in  
 CC screening candidate compounds for remedies. Such method can be performed  
 CC in high throughput, at low cost. The present sequence is a differential  
 CC display PCR primer for the cDNA encoding the human acetyltransferase-like  
 CC protein 20-90-05

PT Identifying a candidate polymorphic repeat within a coding sequence, for  
PT understanding or treating genetic disease, comprises detecting tandem  
PT repeats in a target coding sequence and scoring the repeats for  
PT polymorphic probability.  
XX  
PS Example; Col 483; 588pp; English.  
XX  
CC The invention discloses a method for identifying a candidate polymorphic  
CC repeat within a coding sequence (expressed sequence tag, EST), which  
CC comprises detecting tandem repeats in a target coding sequence, scoring  
CC the repeats for polymorphic probability and generating a dataset  
CC correlating the repeats with polymorphic probability to identify a  
CC candidate polymorphic repeat. The computational methods (polymorphic  
CC marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are  
CC useful for identifying and detecting candidate polymorphic repeats in  
CC human genes, which can be used to understand, treat or eliminate genetic  
CC diseases, predispositions or adverse drug-treatment reactions. Examples  
CC of diseases linked to nucleotide repeats are Machado-Joseph, Haw River  
CC syndrome, Huntington's disease, fragile-X syndrome, Friedrich's ataxia,  
CC myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and  
CC spinocerebellar ataxia. The sequences presented in ABX79793-ABX80022 are  
CC the polymorphic repeats identified for a search of human ESTs

 PT associated with decreased or increased expression or activity of MD23,  
 PT MD24, MD27 or MD212, e.g. cancer.  
 XX PS Example 8; SEQ ID NO 5256; 103pp; English.  
 XX CC The present invention relates to novel human zinc finger-containing  
 CC proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is  
 CC encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2,  
 CC MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome  
 CC 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy,  
 CC or in manufacturing a medicament for treating or preventing a disorder  
 CC associated with decreased or increased expression or activity of MD23,  
 CC MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic  
 CC acids and proteins are also useful for diagnosing or monitoring a disease  
 CC caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic  
 CC acids can also be used as probes to detect and characterize gross  
 CC alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are  
 CC useful in constructing microarrays for measuring gene expression. The  
 CC proteins are useful as therapeutic agents for gene therapy or as  
 CC vaccines. The present sequence was used to illustrate the invention.

XX
XX Examining allergic diseases e.g. atopic dermatitis by differential
PT display based on gene expression of NOR-1 receptor protein, also
PT applicable in screening compounds for treatment of allergic diseases.
XX
PS Example 1; SEQ ID NO 4; 155pp; Japanese.
XX
XX This invention relates to a novel method for examining allergic diseases
CC that comprises comparing the expression levels of a gene encoding the NOR
CC -1 receptor protein between patients and healthy individuals.
CC Specifically, the NOR-1 gene, also referred to as MINOR, is expressed in
CC the specialist white blood cells known as eosinophils and is involved in
CC mediating an allergic reaction. The present invention describes a
CC differential display method that can identify the expression level of
CC this gene in order to identify its usefulness in diagnosing allergic
CC diseases such as atopic dermatitis. Furthermore, compositions can also be
CC used to screen compounds for the treatment of allergic diseases.
CC Accordingly, they exhibit various activities including anti-allergic,
CC anti-inflammatory and dermatological. This oligonucleotide sequence is a
CC PCR primer used to amplify human NOR-1 DNA in an exemplification of the
XX invention.

Sensor array system for remote characterizing gaseous or vapor sample,
has sensors having nucleic acid/fluorophore combination, measuring
apparatus, transmitting device and computer having algorithm for
characterizing analyte.
Disclosure; SEQ ID NO 10; 91pp; English.
The invention relates to a sensor array system for remote characterizing
gaseous or vapor sample, has several sensors providing detectable signal
on contacting analyte and each sensor has nucleic acid/fluorophore
combination, measuring apparatus measures detectable signal, transmitting
device transmits information with respect to detectable signal to remote
location through internet, and computer having residential algorithm for
characterizing analyte. (I) is useful in monitoring chemical hazards, air
quality, and medical conditions, and detecting explosives, mines, and
hazardous chemicals. (II) or (III) is useful in transmitting identified
information on various odors or smells, e.g., vapor or gaseous analytes
through internet. This sequence represents an oligonucleotide used in the
method of the invention.
